

**WASTE CHARACTERIZATION: IN-SITU SOIL LOCATED AT
ISRA AREA I PLANNED EXCAVATION IEL-3**

Introduction

This report presents supporting detailed information relating to the October 22 and 23, 2012 in-situ characterization of prospective soil wastes at the planned ISRA excavation IEL-3 in SSFL Area I.

Background

Soil to be excavated from the designated location in accordance with the ISRA Workplan for SSFL Area I was characterized prior to excavation. A step-by-step approach was followed to accomplish the in-situ characterization. The first step was to review available historical activity and chemical usage information, as well as existing analytical data from past soil sampling in the area. The objective was to identify all substances that could have an impact on determining whether soil in the planned excavation footprint was hazardous or not.

Once potential impacts to the soil were identified, the next step was to develop a sampling plan for the planned excavation footprint. Both random and a combination authoritative/random sample collection location identification methods were employed. In the latter case, the bottoms of trenches where drainpipes were removed during demolition of SSFL Building 1300 were targeted. Trenches corresponding to significant pipe runs were identified and a random sample collection location identified at some point along each run. Standard random sampling methodology was relied upon within the remaining planned excavation footprint, excluding the open trenches. Samples were collected according to the plan and analyzed by a state certified laboratory. Analytical results provided by the laboratory were evaluated to determine whether any regulated substances were present at concentrations exceeding regulatory thresholds governing waste management. Furthermore, the results were also evaluated to assure adequacy for waste characterization purposes based upon the guidelines presented in U.S. EPA SW-846. If the number of samples was not sufficient according to SW-846 criteria, additional samples would be collected and analyzed. In lieu of further sampling, the soil could be characterized as hazardous.

The review of historical information and existing analytical data relevant to planned excavation IEL-3 was based largely on Group 1A RFI results, previous ISRA-related sampling, and Building 1300 chemical usage and demolition records. Evaluation of these data and other sources of relevant information suggested that waste characterization efforts should focus on Regulated Metals, Volatile Organic Compounds (VOC), and Polychlorinated Biphenyls (PCB) in the IEL-3 excavation footprint. A random sampling plan was developed for collection of 29 samples from the planned excavation footprint. The samples were analyzed for CAM 17 metals, VOCs, and PCBs. All samples were collected, contained, and handled according to field practice requirements in SW-846.

Results

Analytical results for the IEL-3 planned excavation area are presented in TestAmerica reports 440-27479 issued on 11/5/12, 440-27510 issued on 11/5/12, and 440-27512 issued on 11/5/12. Regulated metals were detected, but did not exceed any applicable regulatory thresholds. Significant detected Regulated Metals included Lead at a maximum concentration of 34 mg/kg, below the 50 ppm 10 X STLC and 100 ppm 20 X TCLP thresholds. Mercury was detected at a

maximum concentration of 1.3 mg/kg, below the 10 X STLC threshold of 2 ppm and the 20 X TCLP threshold of 4 ppm. Chromium was detected at a maximum concentration of 25 mg/kg, compared to the 10 X STLC threshold of 50 ppm and the 20 X TCLP threshold of 100 ppm.

VOC detections were limited to trace detections of three analytes, including Toluene, which ranged from non-detect to 0.0029 mg/kg. One sample exhibited 1,2,3-Trichlorobenzene, which was detected at 0.0071 mg/kg, and Naphthalene, which was detected at 0.011 mg/kg. PCBs were detected in only one case, with a single detection of Aroclor 1260 at 0.033 mg/kg. These detections are not significant with respect to hazardous waste management regulations.

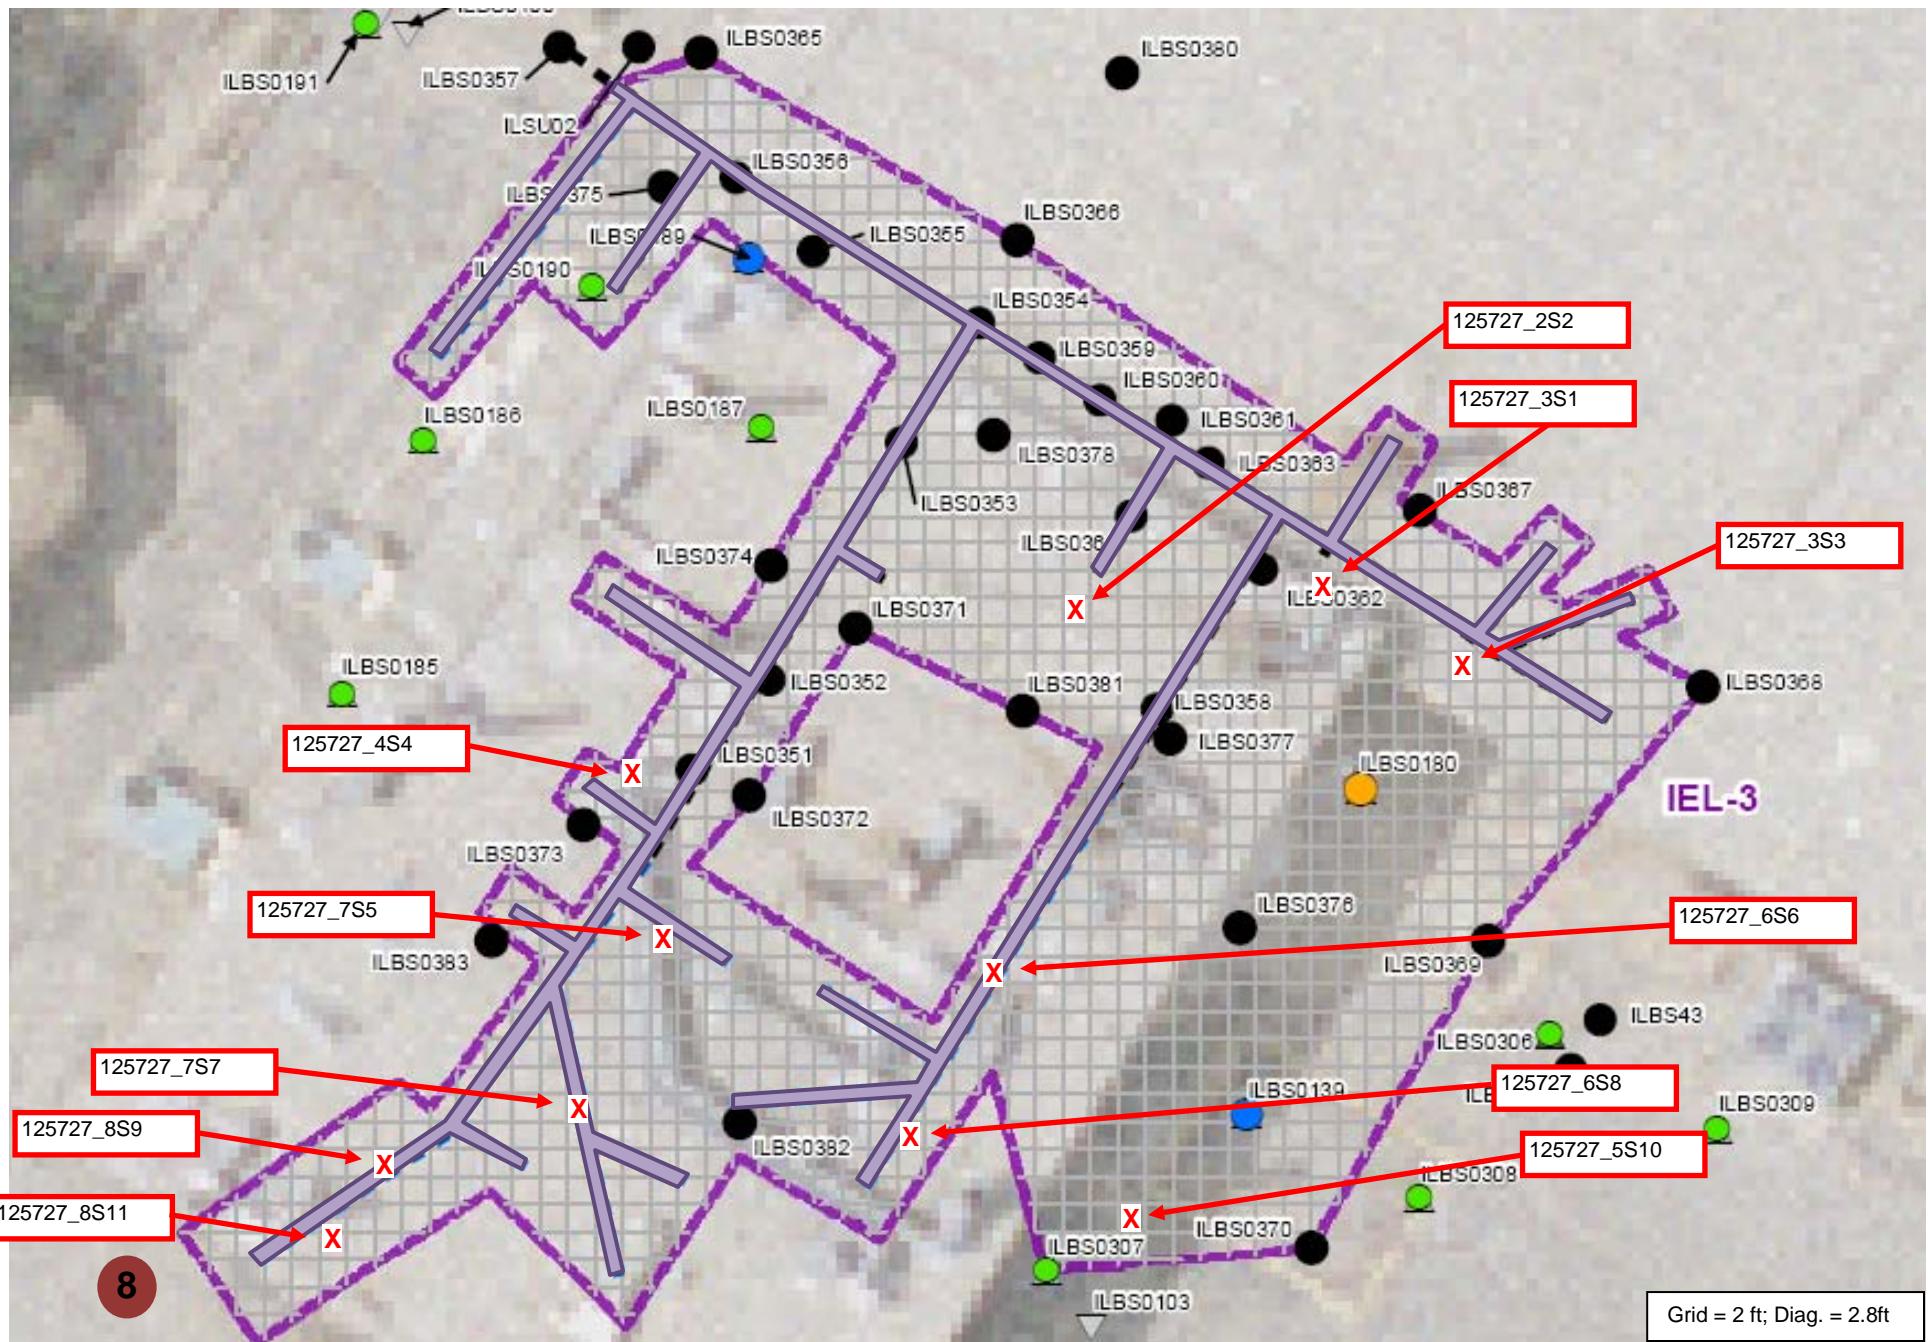

Determination

According to analytical results and generator knowledge, the soil in the planned excavation footprint of SSFL Area I IEL-3:

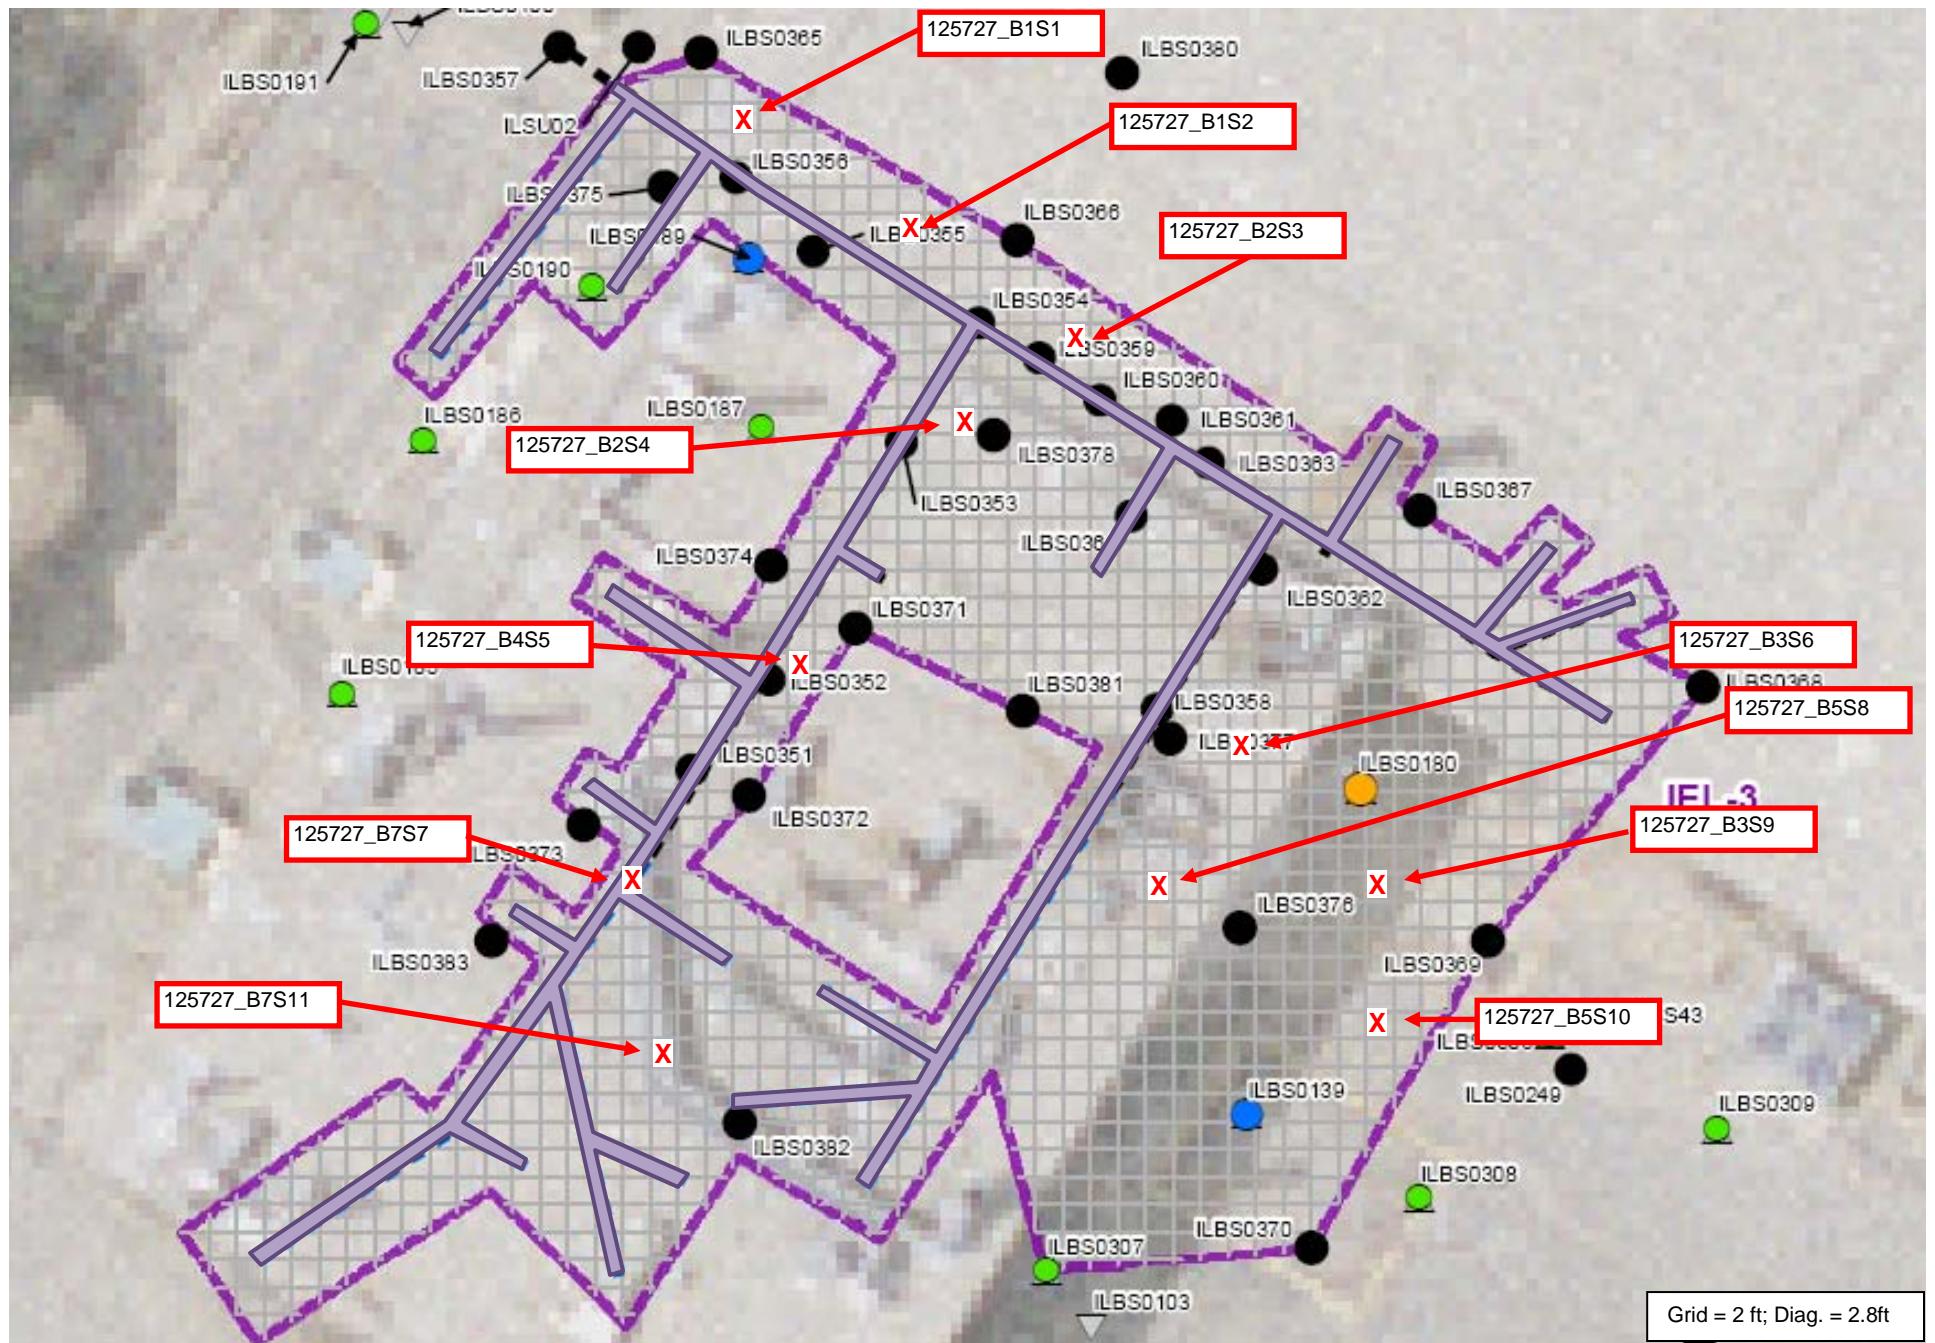

- Is Not a Listed Waste (generator knowledge)
- Is Not ignitable (generator knowledge)
- Is Not corrosive (generator knowledge)
- Is Not reactive (generator knowledge)
- Is Not toxic (analytical results and generator knowledge)
 - Is Not Extremely or Acutely Hazardous Waste
 - Does not exceed any RCRA or Title 22 characteristic thresholds
 - Is Not subject to the Prop. 65 listing
 - Is Not subject to the Title 22 Appendix X list
 - Is Not known by experience or testing to pose a hazard to human health or environment because of its carcinogenicity, acute toxicity, chronic toxicity, bio-accumulative properties, or persistence in the environment.

The soil in SSFL Area I IEL-3 is NON-HAZARDOUS.
