1.0 SCOPE AND INTRODUCTION ................................................................. 1-1  
1.1 SCOPE ............................................................................................. 1-1  
1.2 INTRODUCTION .................................................................................. 1-1  
1.3 A BRIEF DESCRIPTION OF THE 777 FAMILY OF AIRPLANES ........... 1-2  

2.0 AIRPLANE DESCRIPTION .................................................................... 2-1  
2.1 GENERAL CHARACTERISTICS .............................................................. 2-1  
2.1.1 General Characteristics: Model 777-200LR, -300ER, 777F ................. 2-2  
2.2 GENERAL DIMENSIONS ....................................................................... 2-3  
2.2.1 General Dimensions: Model 777-200LR .......................................... 2-3  
2.2.2 General Dimensions: Model 777-300ER .......................................... 2-4  
2.2.3 General Dimensions: Model 777F .................................................. 2-5  
2.3 GROUND CLEARANCES ...................................................................... 2-6  
2.3.1 Ground Clearances: Model 777-200LR ............................................. 2-6  
2.3.2 Ground Clearances: Model 777-300ER ............................................. 2-7  
2.3.3 Ground Clearances: Model 777 Freighter ........................................ 2-8  
2.4 INTERIOR ARRANGEMENTS ................................................................. 2-9  
2.4.1 Typical Interior Arrangements: Model 777-200LR, Typical Two-Class Configurations ............................................. 2-9  
2.4.2 Typical Interior Arrangements: Model 777-200LR, Typical Three-Class Configurations ............................................. 2-10  
2.4.3 Typical Interior Arrangements: Model 777-300ER, Typical Two-Class Configurations ............................................. 2-11  
2.4.4 Typical Interior Arrangements: Model 777-300ER, Typical Three-Class Configurations ............................................. 2-12  
2.5 CABIN CROSS SECTIONS ................................................................. 2-13  
2.5.1 Cabin Cross-Sections: Model 777-200LR, -300ER, First & Business Class Seats ................................................................. 2-13  
2.5.2 Cabin Cross-Sections: Model 777-200LR, -300ER, Business and Economy Class Seats ......................................................... 2-14  
2.6 LOWER CARGO COMPARTMENTS ..................................................... 2-15  
2.6.1 Lower Cargo Compartments: Model 777-200LR, -300ER, Containers and Bulk Cargo ................................................................. 2-15  
2.6.2 Lower Cargo Compartments: Model 777-200LR, 777F, Optional Aft Large Cargo Door ................................................................. 2-16  
2.6.3 Lower Cargo Compartments: Model 777-300ER, Optional Aft Large Cargo Door ................................................................. 2-17  
2.6.4 Main Deck Cargo: Model 777F ........................................................ 2-18  
2.7 DOOR CLEARANCES ......................................................................... 2-19  
2.7.1 Door Clearances: Model 777-200LR, -300ER, 777F, Main Entry Door Locations ................................................................. 2-19

1.0 SCOPE AND INTRODUCTION

1.1 SCOPE

This document provides, in a standardized format, airplane characteristics data for general airport planning. Since operational practices vary among airlines, specific data should be coordinated with the using airlines prior to facility design. Boeing Commercial Airplanes should be contacted for any additional information required.

Content of the document reflects the results of a coordinated effort by representatives from the following organizations:

- Aerospace Industries Association
- Airports Council International - North America
- International Industry Working Group
- International Air Transport Association

The airport planner may also want to consider the information presented in the "Commercial Aircraft Design Characteristics – Trends and Growth Projections," for long range planning needs and can be accessed via the following web site:

www.boeing.com/airports

The document is updated periodically and represents the coordinated efforts of the following organizations regarding future aircraft growth trends:

- International Civil Aviation Organization
- International Coordinating Council of Aerospace Industries Associations
- Airports Council International - North American and World Organizations
- International Industry Working Group
- International Air Transport Association

1.2 INTRODUCTION

This document conforms to NAS 3601. It provides characteristics of the Boeing Model 777-200LR, 777-300ER and 777-Freighter airplanes for airport planners and operators, airlines, architectural and engineering consultant organizations, and other interested industry agencies. Airplane changes and available options may alter model characteristics. The data presented herein reflect typical airplanes in each model category. Data used is generic in scope and not customer-specific.
For additional information please see the Boeing Airport Compatibility webpage:

www.boeing.com/airports

or contact us at

Phone: 562-797-1172

1.3 A BRIEF DESCRIPTION OF THE 777 FAMILY OF AIRPLANES

777-200/-200ER Airplane

The 777-200/-200ER is a twin-engine airplane designed for medium to long range flights. It is powered by advanced high bypass ratio engines. Characteristics unique to the 777 include:

- Two-crew cockpit with digital avionics
- Circular cross-section
- Lightweight aluminum and composite alloys
- Structural carbon brakes
- Six-wheel main landing gears
- Main gear aft axle steering
- High bypass ratio engines
- Fly-by-wire system

777-200LR Airplane

The 777-200LR is a derivative of the 777-200 airplane and is equipped with raked wingtips to provide additional cruise altitude and range. It is powered by high bypass ratio engines that develop higher thrusts than those used in the 777-200/-200ER airplanes. The 777-200LR has an identical fuselage as the 777-200/-200ER but has a wider wingspan due to raked wingtips.

777-300 Airplane

The 777-300 is a second-generation derivative of the 777-200. Two body sections are added to the fuselage to provide additional passenger seating and cargo capacity.

777-300ER Airplane
The 777-300ER is a derivative of the 777-300 airplane and is equipped with raked wingtips for additional cruise altitude and range. It is powered by high bypass ratio engines that develop higher thrusts than those used in the 777-200/-200ER/-300 airplanes. The 777-300ER has an identical fuselage as the 777-300, but has a wider wingspan due to the raked wingtips.

**777-Freighter Airplane**

The 777-Freighter, newest member of the 777 Family of airplanes, is based on the 777-200LR Worldliner ( Longer Range) passenger airplane. The 777-Freighter will fly farther than any other freighter, providing more capacity than any other twin-engine freighter, and will meet QC2 noise standards for maximum accessibility to noise-sensitive airports. The 777-Freighter will share the 777 Family’s advanced features of a state-of-the-art flight deck, fly-by-wire design and an advanced wing design, including raked wing tips. The 777-Freighter is powered by the world’s most powerful commercial jet engine, General Electric’s GE90-110B1L.

The 777-Freighter is designed to integrate smoothly with existing cargo operations and facilitate interlining with 747 freighter fleets. Cargo operators will be able to easily transfer 10-foot-high pallets between the two models via the large main deck cargo door.

**Main Gear Aft Axle Steering**

The main gear axle steering is automatically engaged based on the nose gear steering angle. This allows for less tire scrubbing and easier maneuvering into gates with limited parking clearances.

**High Bypass Ratio Engines**

The 777 airplane is powered by two high bypass ratio engines. The following table shows the available engine options

<table>
<thead>
<tr>

**Document Applicability**

This document contains data specific to the 777-200LR, 777-300ER and 777-Freighter.

Data for the 777-200, 777-200ER, and 777-300 airplanes are contained in document D6-58329.

---

D6-58329-2

REV A  March 2015  1-3
2.0 AIRPLANE DESCRIPTION

2.1 GENERAL CHARACTERISTICS

**Maximum Design Taxi Weight (MTW).** Maximum weight for ground maneuver as limited by aircraft strength and airworthiness requirements. (It includes weight of taxi and run-up fuel.)

**Maximum Design Takeoff Weight (MTOW).** Maximum weight for takeoff as limited by aircraft strength and airworthiness requirements. (This is the maximum weight at start of the takeoff run.)

**Maximum Design Landing Weight (MLW).** Maximum weight for landing as limited by aircraft strength and airworthiness requirements.

**Maximum Design Zero Fuel Weight (MZFW).** Maximum weight allowed before usable fuel and other specified usable agents must be loaded in defined sections of the aircraft as limited by strength and airworthiness requirements.

**Operating Empty Weight (OEW).** Weight of structure, powerplant, furnishing systems, unusable fuel and other unusable propulsion agents, and other items of equipment that are considered an integral part of a particular airplane configuration. Also included are certain standard items, personnel, equipment, and supplies necessary for full operations, excluding usable fuel and payload.

**Maximum Structural Payload.** Maximum design zero fuel weight minus operational empty weight.

**Maximum Seating Capacity.** The maximum number of passengers specifically certificated or anticipated for certification.

**Maximum Cargo Volume.** The maximum space available for cargo.

**Usable Fuel.** Fuel available for aircraft propulsion.

**TOTAL VOLUME 5,656 CU FT (160.2 CU M)**

**FORWARD CARGO COMPARTMENT**
- **AFT CARGO COMPARTMENT**
- **BULK CARGO COMPARTMENT**

**EIGHTEEN LD-3 CONTAINERS**
- **THREE OPTIONAL BODY FUEL TANKS**
- **EIGHT LD-3 CONTAINERS**

**TOTAL VOLUME 4,708 CU FT (133.3 CU M)**

**SIX 96x125 PALLETS**
- **FOUR 96x125 PALLETS**
- **BULK CARGO 600 CU FT**

**TOTAL VOLUME 4,700 CU FT (133.1 CU M)**

**SIX 88x125 PALLETS**
- **FOUR 88x125 PALLETS AND TWO LD-3 CONTAINERS**
- **BULK CARGO 600 CU FT**

**TOTAL VOLUME 4,666 CU FT (132.1 CU M)**
2.6.3 Lower Cargo Compartments: Model 777-300ER, Optional Aft Large Cargo Door

- **Forward Cargo Compartment**: Twenty-four LD-3 containers, 158 cu ft (4.5 cu m) capacity each.
  - Total volume: 7,532 cu ft (213.9 cu m)

- **Aft Cargo Compartment**: Twenty LD-3 containers, 600 cu ft (17.0 cu m) capacity.
  - Total volume: 8,340 cu ft (178.5 cu m)

- **Bulk Cargo Compartment**
  - Eight 96 x 125 pallets
  - Total volume: 6,160 cu ft (174.4 cu m)

- **Optional Lower Hold Laveratories**
  - Eight 96 x 125 pallets
  - Total volume: 5,520 cu ft (156.3 cu m)

- **Bulk Cargo Compartment**
  - Four 96 x 125 pallets
  - Total volume: 600 cu ft (17.0 cu m)
2.6.4 Main Deck Cargo: Model 777F

(27) 96’ X 125’ PALLETS

(11) 96” X 238.5” PALLETS
(5) 96” X 125” PALLETS

(17) 96” X 196” PALLETS

3.0 AIRPLANE PERFORMANCE

3.1 GENERAL INFORMATION

The graphs in Section 3.2 provide information on operational empty weight (OEW) and payload, trip range, brake release gross weight, and fuel limits for airplane models with the different engine options. To use these graphs, if the trip range and zero fuel weight (OEW + payload) are known, the approximate brake release weight can be found.

The graphs in Section 3.3 provide information on F.A.R. takeoff runway length requirements with the different engines at different pressure altitudes. Maximum takeoff weights shown on the graphs are the heaviest for the particular airplane models with the corresponding engines. Standard day temperatures for pressure altitudes shown on the F.A.R. takeoff graphs are given below:

<table>
<thead>
<tr>
<th>PRESSURE ALTITUDE</th>
<th>STANDARD DAY TEMP</th>
</tr>
</thead>
<tbody>
<tr>
<td>FEET</td>
<td>METERS</td>
</tr>
<tr>
<td>0</td>
<td>0</td>

</tr>
<tr>
<td>8,800</td>
<td>2,682</td>
</tr>
<tr>
<td>10,000</td>
<td>3,048</td>
</tr>
</tbody>
</table>

The graphs in Section 3.4 provide information on landing runway length requirements for different airplane weights and airport altitudes. The maximum landing weights shown are the heaviest for the particular airplane model.
3.2 PAYLOAD/RANGE FOR LONG RANGE CRUISE FOR 0.84 MACH CRUISE

3.2.1 Payload/Range for 0.84 Mach Cruise: Model 777-200LR (GE90-100 Series Engines)
### 3.2.2 Payload/Range for 0.84 Mach Cruise: Model 777-300ER (GE90-115BL Engines)

[Diagram showing payload and range for different weights and Mach numbers.]

- **Max Zero Fuel Weight**: 524,000 lb (237,662 kg)
- **Fuel Capacity**: 320,660 lb (145,540 kg)
- **Consulting for specific operating procedure and crew prior to facility design.**
3.2.3 Payload/Range for 0.84 Mach Cruise: Model 777F (GE90-100 Series Engines)
3.3 F.A.R. TAKEOFF RUNWAY LENGTH REQUIREMENTS

3.3.1 F.A.R. Takeoff Runway Length Requirements - Standard Day: Model 777-200LR (GE90-100B1L Engines)
3.3.3 F.A.R. Takeoff Runway Length Requirements - Standard Day + 49°F (STD + 27°C): Model 777-200LR (GE90-110B1L Engines)

3.4.9  F.A.R. Landing Runway Length Requirements - Flaps 25: Model 777F (GE90-115BL Engines)
3.4.10 F.A.R. Landing Runway Length Requirements - Flaps 30: Model 777F (GE90-115BL Engines)
4.0 AIRPLANE PERFORMANCE

4.1 GENERAL INFORMATION

The 777 main landing gear consists of two main struts, each strut with six wheels. The steering system incorporates aft axle steering of the main landing gear in addition to the nose gear steering. The aft axle steering system is hydraulically actuated and programmed to provide steering ratios proportionate to the nose gear steering angles. During takeoff and landing, the aft axle steering system is centered, mechanically locked, and depressurized.

The turning radii and turning curves shown in this section are derived from airplane geometry. Other factors that could influence the geometry of the turn include:

1. Engine power settings
2. Center of gravity location
3. Airplane weight
4. Pavement surface conditions
5. Amount of differential braking
6. Ground speed
4.2 TURNING RADII

4.2.1 Turning Radii – No Slip Angle: Model 777-200LR, 777F

NOTES: DATA SHOWN FOR AIRPLANE WITH AFT AXLE STEERING
ACTUAL OPERATING TURNING RADII MAY BE GREATER THAN SHOWN

4.5 RUNWAY AND TAXIWAY TURN PATHS

4.5.1 Runway and Taxiway Turn Paths - Runway-to-Taxiway, More Than 90 Degrees: Model 777-200LR, -300ER, 777F

NOTES:
- BEFORE DETERMINING THE SIZE OF THE INTERSECTION FILLET, CHECK WITH THE AIRLINES REGARDING THE OPERATING PROCEDURES THAT THEY USE AND THE AIRCRAFT TYPES THEY ARE EXPECTED TO USE AT THE AIRPORT
- 777-300ER DATA SHOWN. 777F DATA IS LESS STRINGENT.
4.5.2 Runway and Taxiway Turn Paths - Runway-to-Taxiway, 90 Degrees:
Model 777-200LR, -300ER, 777F

NOTES:

- BEFORE DETERMINING THE SIZE OF THE INTERSECTION FILLET, CHECK WITH THE
  AIRLINES REGARDING THE OPERATING PROCEDURES THAT THEY USE AND THE
  AIRCRAFT TYPES THEY ARE EXPECTED TO USE AT THE AIRPORT

- 777-300ER DATA SHOWN. CALCULATED EDGE MARGIN FOR THE 777F IS
  APPROXIMATELY 20 FT (6.1 M) INSTEAD OF 14 FT (4.3 M) AS SHOWN.
4.5.3 Runway and Taxiway Turn Paths - Taxiway-to-Taxiway, 90 Degrees, Nose Gear Tracks Centerline: Model 777-200LR, -300ER, 777F

NOTES:

- BEFORE DETERMINING THE SIZE OF THE INTERSECTION FILLET, CHECK WITH THE AIRLINES REGARDING THE OPERATING PROCEDURES THAT THEY USE AND THE AIRCRAFT TYPES THEY ARE EXPECTED TO USE AT THE AIRPORT
- 777-300ER DATA SHOWN. CALCULATED EDGE MARGIN FOR THE 777F IS APPROXIMATELY 22 FT (6.7 M) INSTEAD OF 14 FT (4.3 M) AS SHOWN.
4.5.4 Runway and Taxiway Turn Paths - Taxiway-to-Taxiway, 90 Degrees, Cockpit Tracks Centerline: Model 777-200LR, -300ER, 777F

NOTES:

- BEFORE DETERMINING THE SIZE OF THE INTERSECTION FILLET, CHECK WITH THE AIRLINES REGARDING THE OPERATING PROCEDURES THAT THEY USE AND THE AIRCRAFT TYPES THEY ARE EXPECTED TO USE AT THE AIRPORT
- 777-300ER DATA SHOWN. CALCULATED EDGE MARGIN FOR THE 777F IS APPROXIMATELY 17 FT (5.2 M) INSTEAD OF 4 FT (1.2 M) AS SHOWN.
4.5.5  Runway and Taxiway Turn Paths - Taxiway-to-Taxiway, 90 Degrees, Judgmental Oversteering: Model 777-200LR, -300ER, 777F

NOTES:
- BEFORE DETERMINING THE SIZE OF THE INTERSECTION FILLET, CHECK WITH THE AIRLINES REGARDING THE OPERATING PROCEDURES THAT THEY USE AND THE AIRCRAFT TYPES THEY ARE EXPECTED TO USE AT THE AIRPORT
- 777-300ER DATA SHOWN. 777F IS LESS STRINGENT
4.6 RUNWAY HOLDING BAY: MODEL 777-200LR, -300ER, 777F

NOTE
BEFORE DETERMINING THE SIZE OF THE INTERSECTION FILLET, CHECK WITH THE AIRLINES REGARDING THE OPERATING PROCEDURES THAT THEY USE AND THE AIRCRAFT TYPES THAT ARE EXPECTED TO SERVE THE AIRPORT.

5.0 TERMINAL SERVICING

During turnaround at the terminal, certain services must be performed on the aircraft, usually within a given time, to meet flight schedules. This section shows service vehicle arrangements, schedules, locations of service points, and typical service requirements. The data presented in this section reflect ideal conditions for a single airplane. Service requirements may vary according to airplane condition and airline procedure.

Section 5.1 shows typical arrangements of ground support equipment during turnaround. As noted, if the auxiliary power unit (APU) is used, the electrical, air start, and air-conditioning service vehicles would not be required. Passenger loading bridges or portable passenger stairs could be used to load or unload passengers.

Sections 5.2 and 5.3 show typical service times at the terminal. These charts give typical schedules for performing service on the airplane within a given time. Service times could be rearranged to suit availability of personnel, airplane configuration, and degree of service required.

Section 5.4 shows the locations of ground service connections in graphic and in tabular forms. Typical capacities and service requirements are shown in the tables. Services with requirements that vary with conditions are described in subsequent sections.

Section 5.5 shows typical sea level air pressure and flow requirements for starting different engines. The curves are based on an engine start time of 90 seconds.

Section 5.6 shows air conditioning requirements for heating and cooling (pull-down and pull-up) using ground conditioned air. The curves show airflow requirements to heat or cool the airplane within a given time at ambient conditions.

Section 5.7 shows air conditioning requirements for heating and cooling to maintain a constant cabin air temperature using low pressure conditioned air. This conditioned air is supplied through an 8-in ground air connection (GAC) directly to the passenger cabin, bypassing the air cycle machines.

Section 5.8 shows ground towing requirements for various ground surface conditions.
5.1 AIRPLANE SERVICING ARRANGEMENT - TYPICAL TURNAROUND

5.1.1 Airplane Servicing Arrangement - Typical Turnaround: Model 777-200LR

NOTE: IF THE APU IS USED, ELECTRICAL, PNEUMATIC, AND AIR CONDITIONING TRUCKS ARE NOT REQUIRED.
5.1.2 Airplane Servicing Arrangement - Typical Turnaround: Model 777-300ER

NOTE: IF THE APU IS USED, ELECTRICAL PNEUMATIC AND AIR CONDITIONING TRUCKS ARE NOT REQUIRED.
5.1.3 Airplane Servicing Arrangement - Typical Turnaround: Model 777F
5.2.3 Terminal Operations - Turnaround Station: Model 777F

**Parameters**
- 10,000 LBS CARGO EXCHANGE
- MAIN DECK CARGO: (37) 96" X 126" PALLETS
- FUEL AIRPLANE: 59.0
- SERVICE LAVATORIES: 3.5
- SERVICE POTABLE WATER: 5.0
- PUSH BACK: 1.0
- CRITICAL PATH: 75.0

**Notes**
- SERVICE TIME WILL INCREASE BY SIX MINUTES IF MIXED PALL CONFIGURATION IS USED FOR MAIN DECK CARGO

5.5.1 Engine Start Pneumatic Requirements - Sea Level: Model 777-200LR, -300ER

NOTES:
1. ALTITUDE = SEA LEVEL
2. 90 SECONDS TO IDLE
3. 2 GROUND CONNECTIONS USED

---

Temperature at air start connectors:
- 50°F (10°C)
- 150°F (65°C)
- 250°F (121°C)
- 350°F (177°C)
- 450°F (232°C)

---

Pressure at ground connection:
- 50°F (10°C)
- 150°F (65°C)
- 250°F (121°C)
- 350°F (177°C)
- 450°F (232°C)
5.6 GROUND PNEUMATIC POWER REQUIREMENTS

5.6.1 Ground Pneumatic Power Requirements – Heating, Pull-Up: Model 777-200LR

CONDITIONS:
ALL EXTERIOR DOORS AND WINDOWS CLOSED
OUTSIDE TEMPERATURE \(-40°F\) \((-40°C)\)
INITIAL CABIN TEMPERATURE \(-25°F\) \((-32°C)\)
NO SOLAR HEAT LOAD

REGULATION FANS OFF
CHILLERS OFF
MINIMUM LIGHTING
NO OCCUPANTS

NOTE: THIS GRAPH SHOWS THE TIME REQUIRED TO HEAT THE CABIN TO \(75°F\) \((24°C)\) AS A FUNCTION OF AIRFLOW WHEN USING A CONDITIONED AIR GROUND SOURCE.
5.6.2 Ground Pneumatic Power Requirements – Cooling, Pull-Down: Model 777-200LR

CONDITIONS:
- ALL EXTERIOR DOORS AND WINDOWS CLOSED
- OUTSIDE TEMPERATURE 103°F (39°C)
- INITIAL CABIN TEMPERATURE 115°F (46°C)
- FULL SOLAR LOAD
- RECIPIRICATION FANS OFF
- CHILLERS ON
- MINIMUM LIGHTING
- NO OCCUPANTS

NOTE: This graph shows the time required to cool the cabin to 75°F (24°C) as a function of airflow when using a conditioned air ground source.
5.6.3 Ground Conditioned Air Requirements – Heating, Pull-Up: Model 777-300ER

Conditions:
- All exterior doors and windows closed
- Outside temperature: -40°F (-40°C)
- Initial cabin temperature: -25°F (-32°C)
- No solar heat load
- Recirculation fans off
- Chillers off
- Minimum lighting
- No occupants

Note: This graph shows the time required to heat the cabin to 75°F (24°C) as a function of airflow when using a conditioned air ground source.
5.6.4 Ground Conditioned Air Requirements – Cooling, Pull-Down: Model 777-300ER

CONDITIONS:
- ALL EXTERIOR DOORS AND WINDOWS CLOSED
- CHILLERS ON
- MINIMUM LIGHTING
- NO OCCUPANTS

FULL SOLAR LOAD

TOTAL AIRFLOW AT GROUND AIR CONNECTOR

Kilograms Per Minute

PAULS PER MINUTE

TIME TO COOL CABIN TO 75° F (24°C) – MINUTES

AIR TEMPERATURE AT GROUND AIR CONNECTOR

1. 50°F (10°C)
2. 55°F (13°C)
3. 60°F (16°C)
4. 65°F (18°C)
5. 70°F (21°C)
6. 75°F (24°C)

NOTE: THIS GRAPH SHOWS THE TIME REQUIRED TO COOL THE CABIN TO 75°F (24°C) AS A FUNCTION OF AIRFLOW WHEN USING A CONDITIONED AIR GROUND SOURCE.
5.6.5 Ground Conditioned Air Requirements – Heating, Pull-Up: Model 777F

**CONDITIONS:**
- All exterior doors and windows closed
- Outside temperature 70°F (21°C)
- Main deck solar load 0 Btu/min - main deck has few windows; superannuary area is negligible
- Main deck electrical load 75 Btu/min - maximum heat dissipation from cargo lighting
- Recirculation fans off
- Main deck and chiller heat dissipation 0 Btu/min - no internal chiller
- No heat generating cargo
- Initial cabin temperature: 15°F (−9°C)
- Skin temperature: 15°F (−9°C)
- Main deck flow switch selected to normal
- Forward cargo air conditioning (FAC) selected "ON" with 14.6% of total flow
- Aft cargo air conditioning (ACAC) assumed "OFF" (customer option)
- Main deck heat transfer coefficient is 872 Btu/min/°F with a 15% floor heat transfer factor. Does not include the nose cargo barrier.

**LEGEND:**
- 20 degrees F (< 3 degrees C)
- 40 degrees F (< 4 degrees C)
- 45 degrees F (< 7 degrees C)
- 50 degrees F (10 degrees C)
- 55 degrees F (13 degrees C)
- 60 degrees F (16 degrees C)

**NOTE:**
This graph shows the time required to cool the main deck from 115°F (46°C) to 75°F (24°C) as a function of pre-conditioned air flow and temperature, at the airplane's ground air connectors, for the conditions stated.
5.6.6 Ground Conditioned Air Requirements – Cooling, Pull-Down: Model 777F

CONDITIONS:
- All exterior doors and windows closed
- Outside temperature: 100°F (38°C)
- Main deck solar load: 0 BTU/h/ft² - Main deck has few windows; supertunery area is negligible
- Main deck electrical load: 75 BTU/h/ft² - Maximum heat dissipation from cooling lighting
- Recirculation fan off
- Main deck and chillier heat dissipation: 0 BTU/h/ft² - No no chiller
- No heat generating cargo
- Initial cabin temperature: 115°F (46°C)
- Skin temperature: 110°F (44°C)
- Main deck flow switch selected to normal
- Forward cargo air conditioning (FAC) selected "OFF" with 145% of total flow
- Aft cargo air conditioning (AC) assumed "OFF" customer option
- Main deck heat transfer coefficient is 272 BTU/h/ft² with a 3% floor heat transfer factor; does not include the rigid cargo barrier.

LEGEND:
- 95 degrees F (35 degrees C)
- 90 degrees F (32 degrees C)
- 85 degrees F (29 degrees C)
- 80 degrees F (26 degrees C)
- 75 degrees F (24 degrees C)
- 70 degrees F (21 degrees C)

NOTE:
This graph shows the time required to cool the main deck from 115°F (46°C) to 75°F (24°C) as a function of pre-conditional air flow and temperature, at the airplane’s ground air connectors, for the conditions stated.
5.7 CONDITIONED AIR REQUIREMENTS

5.7.1 Total Ground Cart Flow – Ground Cart Supply Temperature: Model 777F

CONDITIONS:
- All exterior doors and windows closed.
- Outside temperature: -40°F to 40°F.
- Solar load 0 BTU/Min (Main deck has few windows, windows, superjumpery area is negligible).
- Main deck electrical load 0 BTU/Min.
- Recirculation fans selected "off".
- Chillers selected "off".
- Animal heat load 0 BTU/Min.
- Cabin temperature: maintained at 75°F (24°C).
- Skin temperature: -40°F to 40°F.
- Main deck flow switch selected to normal.
- Forward cargo air conditioning (FCAC) selected "on" with 14.6% of total flow.
- Aft cargo air conditioning (ACAC) selected "off" customer option.
- Main deck heat transfer coefficient is 272 BTU/Min°F with a 10% floor heat transfer factor does not include the rigid cargo barrier.

NOTE:
This graph provides predicted pre-conditioned air (PCA) temperature as a function of airflow that is required at the airplane's ground air connection (GAC), to maintain the main cargo deck at 74°F (24°C). The conditions for which this graph was developed are considered worst case "cold" operation.
5.7.2 Conditioned Air Flow Requirements - Steady State Airflow: Model 777-200LR, -300ER

CONDITIONS FOR LINE (1):
ALL EXTERIOR DOORS AND WINDOWS CLOSED
OUTSIDE TEMPERATURE 103°F (39°C)
FULL SOLAR AND ELECTRICAL HEAT LOADS
RECIIRCULATING FANS OFF
CHILLERS ON
426 PASSENGERS (777-200LR)
505 PASSENGERS (777-300ER)
CABIN TEMPERATURE MAINTAINED AT 75°F (24°C)

CONDITIONS FOR LINE (2):
ALL EXTERIOR DOORS AND WINDOWS CLOSED
OUTSIDE TEMPERATURE -40°F (-40°C)
NO SOLAR AND ELECTRICAL HEAT LOADS
RECIIRCULATING FANS OFF
CHILLERS OFF
NO PASSENGERS
CABIN TEMPERATURE MAINTAINED AT 75°F (24°C)

NOTE:
THIS GRAPH SHOWS REQUIRED AIR TEMPERATURES AT THE GROUND AIR CONNECTION IN ORDER TO MAINTAIN CABIN TEMPERATURE AT 75°F (24°C)
5.7.3 Conditioned Air Flow Requirements - Steady State Airflow: Model 777F

CONDITIONS:
- All exterior doors and windows closed.
- Outside temperature: 60°F (21°C).
- Full solar load: 0 BTU/min. Main deck has few windows; supernumerary area is negligible.
- Main deck electrical load: 75 BTU/min. - Maximum heat dissipation from cargo lighting.
- Recirculation fans selected "off".
- Main deck chiller: 0 BTU/min - No HD chiller, supernumerary zone has chiller.
- Maximum animal heat load: 2800 BTU/min.

- Cabin temperature maintained at 75°F (24°C).
- Skin temperature: 118°F (48°C).
- Main deck flow switch selected to normal.
- Forward cargo air conditioning (PAC) selected "on" with 14.6% of total flow.
- Flight deck flow split: 6.5% of total flow.
- Aft cargo air conditioning (PAC) assumed "off" - Customer option.
- Main deck underfloor area heat transfer: 27.2 BTU/min - 10% approximation with no transfer through rigid barriers.

**Graph:**

- Total airflow to airplane pounds (kilograms) per minute
- Air temperature at ground connection - °F (°C)

**Note:**
This graph provides predicted pre-conditioned air (PCA) temperature as a function of airflow that is required at the airplane's ground air connection (GAC) to maintain the main cargo deck at 75°F (24°C). The conditions for which this graph was developed are considered worst case "hot day" operation.
5.7.4 Air Conditioning Gauge Pressure Requirements - Steady State
Airflow: Model 777-200LR, -300ER
5.7.5 Conditioned Air Flow Requirements - Steady State BTU's: Model 777-200LR, -300ER

CONDITIONS FOR LINE (1) – HEATING
- All exterior doors and windows closed
- No solar and electrical heat loads
- Recirculating fans off, chillers off
- No occupants
- Cabin temperature maintained at 75°F (24°C)

CONDITIONS FOR LINE (2) – COOLING
- All exterior doors and windows closed
- Full solar electrical heat loads
- Recirculating fans off, chillers on
- 426 occupants (777-200LR)
- 505 occupants (777-300ER)
- Cabin temperature maintained at 75°F (24°C)

NOTE: This graph shows required cooling and heating BTU's as a function of ambient temperature to maintain cabin temperature at 75°F (24°C).
5.7.6 Conditioned Air Flow Requirements - Steady State BTU's: Model 777F

CONDITIONS:
- All exterior doors and windows closed.
- Outside temperature: 102°F (39°C).
- Solar load: 5 BTU/min - Main deck has few windows, supernumerary area is negligible.
- Main deck electrical load: 75 BTU/min - Maximum heat dissipation from cargo lighting.
- Recirculation fans selected "off".
- Supernumerary chiller: 51 BTU/min dissipation.
- Flight deck occupants: 4 crew/observers.
- Cabin temperature: maintained at 73°F (23°C).
- Supernumerary occupant heat load: 4 occupants.
- Skin temperature: 118°F (48°C).
- Forward cargo air conditioning (FCAC) selected "on" with 14% of total flow.
- Aft cargo air conditioning (ACAC) assumed "off" - customer option.
- Main deck heat transfer coefficient is 0.72 BTU/min°F with a 10% floor heat transfer factor, does not include the rigid cargo barrier.
- Flight deck flow split: 61% of total flow.

NOTE:
This graph provides predicted pre-conditioned air (PCA) temperature as a function of airflow is required, at the airplane's ground air connection (GAC), to maintain the main cargo deck, flight deck and supernumerary at 73°F (23°C). The conditions for which this graph was developed are considered worst case cooling operation.
5.7.7 Conditioned Air Flow Requirements - Steady State BTU's: Model 777F

**Conditions:**
- All exterior doors and windows closed.
- Outside temperature: -40°F (-40°C).
- Solar load: 0 BTU/Min. Main deck has few windows; superstructure area is negligible.
- Main deck electrical load: 0 BTU/Min.
- Recirculation fans selected 'Off'.
- Superstructure chiller: 0 BTU/Min. dissipation.
- Animal heat load: 0 BTU/Min.
- Flight deck occupants: 8 crew/observer.
- Cabin temperature maintained at 75°F (24°C).
- Sign temperature: 100°F (40°C).
- Forward cargo air conditioning (OFAAC): selected 'ON' with 15% of total flow.
- Aft cargo air conditioning (ACAC): assumed 'OFF' - customer option.
- Main deck heat transfer coefficient is 10.2 BTU/Min°F with a 10% floor heat transfer factor does not include the door barrier.
- Flight deck flow split 6% of total flow.

**Note:**
This graph provides predicted pre-conditioned air (PCA) temperature as a function of airflow that is required, at the airplane's cooling air connection (OCA), to maintain the main cargo deck, flight deck, and superstructure at 75°F (24°C). The conditions for which this graph was developed are considered worst case heating operation.
5.8 GROUND TOWING REQUIREMENTS

5.8.1 Ground Towing Requirements - English and Metric Units:

Model 777F

NOTES:
1. SHOWS A 777 WEIGHING 537,000 POUNDS (243,579 KILOGRAMS) BEING PUSHED UP A 2.5% SLOPE ON SANDER ICE AT 8° BACKING AGAINST IDLE ENGINE AT IDLE THRUST. 360,000 POUNDS (163,445 KILOGRAMS) OF DRAW BAR PUSH AND A WHEEL TRACTION LOAD OF 103,743 POUNDS (47,097 KILOGRAMS) ARE REQUIRED FOR TOWING.
2. UNUSUAL BREAKAWAY CONDITIONS NOT SHOWN
3. STRAIGHT-LINE TOW
4. COEFFICIENTS OF FRICTION ARE ESTIMATED FOR RUBBER-TIRED TOW VEHICLES.
6.0 JET ENGINE WAKE AND NOISE DATA

6.1 JET ENGINE EXHAUST VELOCITIES AND TEMPERATURES

This section shows exhaust velocity and temperature contours aft of the 777-200LR, 777-300ER, and 777 Freighter airplanes. The contours were calculated from a standard computer analysis using three-dimensional viscous flow equations with mixing of primary, fan, and free-stream flow. The presence of the ground plane is included in the calculations as well as engine tilt and toe-in. Mixing of flows from the engines is also calculated. The analysis does not include thermal buoyancy effects which tend to elevate the jet wake above the ground plane. The buoyancy effects are considered to be small relative to the exhaust velocity and therefore are not included.

The graphs show jet wake velocity and temperature contours for a representative engine. The results are valid for sea level, static, standard day conditions. The effect of wind on jet wakes was not included. There is evidence to show that a downwind or an upwind component does not simply add or subtract from the jet wake velocity, but rather carries the whole envelope in the direction of the wind. Crosswinds may carry the jet wake contour far to the side at large distances behind the airplane.
6.1.1 Predicted Jet Engine Exhaust Velocity Contours – Idle Thrust: Model 777-200LR, -300ER, 777F
6.1.2 Predicted Jet Engine Exhaust Velocity Contours - Breakaway
Thrust: Model 777-200LR, -300ER, 777F
6.1.3 Predicted Jet Engine Exhaust Velocity Contours - Takeoff Thrust: Model 777-200LR, -300ER, 777F
6.1.4 Predicted Jet Engine Exhaust Temperature Contours - Idle Thrust:
Model 777-200LR, -300ER, 777F

Temperature contours for idle power conditions are not shown. The maximum temperature aft of the airplane is predicted to be less than 100°F (30°C) for standard day conditions of 59°F (15°C).
6.1.5 Predicted Jet Engine Exhaust Temperature Contours – Breakaway Thrust: Model 777-200LR, -300ER, 777F

Temperature contours for breakaway power conditions are not shown. The maximum temperature aft of the airplane is predicted to be less than 100°F (30°C) for standard day conditions of 59°F (15°C).
6.1.6  Predicted Jet Engine Exhaust Temperature Contours – Takeoff Thrust: Model 777-200LR, -300ER, 777F
6.2 AIRPORT AND COMMUNITY NOISE

Airport noise is of major concern to the airport and community planner. The airport is a major element in the community's transportation system and, as such, is vital to its growth. However, the airport must also be a good neighbor, and this can be accomplished only with proper planning. Since aircraft noise extends beyond the boundaries of the airport, it is vital to consider the impact on surrounding communities. Many means have been devised to provide the planner with a tool to estimate the impact of airport operations. Too often they oversimplify noise to the point where the results become erroneous. Noise is not a simple subject; therefore, there are no simple answers.

The cumulative noise contour is an effective tool. However, care must be exercised to ensure that the contours, used correctly, estimate the noise resulting from aircraft operations conducted at an airport.

The size and shape of the single-event contours, which are inputs into the cumulative noise contours, are dependent upon numerous factors. They include the following:

1. Operational Factors
   a. Aircraft Weight-Aircraft weight is dependent on distance to be traveled, en route winds, payload, and anticipated aircraft delay upon reaching the destination.
   b. Engine Power Settings-The rates of ascent and descent and the noise levels emitted at the source are influenced by the power setting used.
   c. Airport Altitude-Higher airport altitude will affect engine performance and thus can influence noise.

2. Atmospheric Conditions-Sound Propagation
   a. Wind-With stronger headwinds, the aircraft can take off and climb more rapidly relative to the ground. Also, winds can influence the distribution of noise in surrounding communities.
   b. Temperature and Relative Humidity-The absorption of noise in the atmosphere along the transmission path between the aircraft and the ground observer varies with both temperature and relative humidity.

3. Surface Condition-Shielding, Extra Ground Attenuation (EGA)
   a. Terrain-If the ground slopes down after takeoff or before landing, noise will be reduced since the aircraft will be at a higher altitude above ground. Additionally, hills, shrubs, trees, and large buildings can act as sound buffers.
All these factors can alter the shape and size of the contours appreciably. To demonstrate the effect of some of these factors, estimated noise level contours for two different operating conditions are shown below. These contours reflect a given noise level upon a ground level plane at runway elevation.

**Condition 1**

<table>
<thead>
<tr>
<th>Landing</th>
<th>Takeoff</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum Structural Landing Weight</td>
<td>Maximum Gross Takeoff Weight</td>
</tr>
<tr>
<td>10-knot Headwind</td>
<td>Zero Wind</td>
</tr>
<tr>
<td>3° Approach</td>
<td>84 °F</td>
</tr>
<tr>
<td>84 °F</td>
<td>Humidity 15%</td>
</tr>
<tr>
<td>Humidity 15%</td>
<td></td>
</tr>
</tbody>
</table>

As indicated from these data, the contour size varies substantially with operating and atmospheric conditions. Most aircraft operations are, of course, conducted at less than maximum gross weights because average flight distances are much shorter than maximum aircraft range capability and average load factors are less than 100%. Therefore, in developing cumulative contours for planning purposes, it is recommended that the airlines serving a particular city be contacted to provide operational information.

**Condition 2**

<table>
<thead>
<tr>
<th>Landing</th>
<th>Takeoff</th>
</tr>
</thead>
<tbody>
<tr>
<td>85% of Maximum Structural Landing Weight</td>
<td>80% of Maximum Gross Takeoff Weight</td>
</tr>
<tr>
<td>10-knot Headwind</td>
<td>10-knot Headwind</td>

<tr>
<td>3° Approach</td>
<td>59 °F</td>
</tr>
<tr>
<td>59 °F</td>
<td>Humidity 70%</td>
</tr>
<tr>
<td>Humidity 70%</td>
<td></td>
</tr>
</tbody>
</table>

As indicated from these data, the contour size varies substantially with operating and atmospheric conditions. Most aircraft operations are, of course, conducted at less than maximum gross weights because average flight distances are much shorter than maximum aircraft range capability and average load factors are less than 100%. Therefore, in developing cumulative contours for planning purposes, it is recommended that the airlines serving a particular city be contacted to provide operational information.
In addition, there are no universally accepted methods for developing aircraft noise contours or for relating the acceptability of specific zones to specific land uses. It is therefore expected that noise contour data for particular aircraft and the impact assessment methodology will be changing. To ensure that the best currently available information of this type is used in any planning study, it is recommended that it be obtained directly from the Office of Environmental Quality in the Federal Aviation Administration in Washington, D.C.

It should be noted that the contours shown herein are only for illustrating the impact of operating and atmospheric conditions and do not represent the single-event contour of the family of aircraft described in this document. It is expected that the cumulative contours will be developed as required by planners using the data and methodology applicable to their specific study.
7.0 PAVEMENT DATA

7.1 GENERAL INFORMATION

A brief description of the pavement charts that follow will help in their use for airport planning. Each airplane configuration is depicted with a minimum range of six loads imposed on the main landing gear to aid in interpolation between the discrete values shown. All curves for any single chart represent data based on rated loads and tire pressures considered normal and acceptable by current aircraft tire manufacturer's standards. Tire pressures, where specifically designated on tables and charts, are at values obtained under loaded conditions as certificated for commercial use.

Section 7.2 presents basic data on the landing gear footprint configuration, maximum design taxi loads, and tire sizes and pressures.

Maximum pavement loads for certain critical conditions at the tire-to-ground interface are shown in Section 7.3, with the tires having equal loads on the struts.

Pavement requirements for commercial airplanes are customarily derived from the static analysis of loads imposed on the main landing gear struts. The charts in Section 7.4 are provided in order to determine these loads throughout the stability limits of the airplane at rest on the pavement. These main landing gear loads are used as the point of entry to the pavement design charts, interpolating load values where necessary.

The flexible pavement design curves (Section 7.5) are based on procedures set forth in Instruction Report No. S-77-1, "Procedures for Development of CBR Design Curves," dated June 1977, and as modified according to the methods described in ICAO Aerodrome Design Manual, Part 3, Pavements, 2nd Edition, 1983, Section 1.1 (The ACN-PCN Method), and utilizing the alpha factors approved by ICAO in October 2007. Instruction Report No. S-77-1 was prepared by the U.S. Army Corps of Engineers Waterways Experiment Station, Soils and Pavements Laboratory, Vicksburg, Mississippi. The line showing 10,000 coverages is used to calculate Aircraft Classification Number (ACN).

The following procedure is used to develop the curves shown in Section 7.5:

1. Having established the scale for pavement depth at the bottom and the scale for CBR at the top, an arbitrary line is drawn representing 6,000 annual departures.

2. Values of the aircraft gross weight are then plotted.

3. Additional annual departure lines are drawn based on the load lines of the aircraft gross weights already established.

4. An additional line representing 10,000 coverages (used to calculate the flexible pavement Aircraft Classification Number) is also placed.
All Load Classification Number (LCN) curves (Sections 7.6 and 7.8) have been developed from a computer program based on data provided in International Civil Aviation Organization (ICAO) document 9157-AN/901, *Aerodrome Design Manual*, Part 3, “Pavements”, First Edition, 1977. LCN values are shown directly for parameters of weight on main landing gear, tire pressure, and radius of relative stiffness (l) for rigid pavement or pavement thickness or depth factor (h) for flexible pavement.

Rigid pavement design curves (Section 7.7) have been prepared with the Westergaard equation in general accordance with the procedures outlined in the *Design of Concrete Airport Pavement* (1955 edition) by Robert G. Packard, published by the American Concrete Pavement Association, 3800 North Wilke Road, Arlington Heights, Illinois 60004-1268. These curves are modified to the format described in the Portland Cement Association publication XP6705-2, *Computer Program for Airport Pavement Design (Program PDILB)*, 1968, by Robert G. Packard.

The following procedure is used to develop the rigid pavement design curves shown in Section 7.7:

1. Having established the scale for pavement thickness to the left and the scale for allowable working stress to the right, an arbitrary load line is drawn representing the main landing gear maximum weight to be shown.

2. Values of the subgrade modulus (k) are then plotted.

3. Additional load lines for the incremental values of weight on the main landing gear are drawn on the basis of the curve for k = 300, already established.

The rigid pavement design curves (Section 7.9) have been developed based on methods used in the FAA Advisory Circular AC 150/5320-6D July 7, 1995. The following procedure is used to develop the curves shown in Section 7.9:

1. Having established the scale for pavement flexure strength on the left and temporary scale for pavement thickness on the right, an arbitrary load line is drawn representing the main landing gear maximum weight to be shown at 5,000 coverages.

2. Values of the subgrade modulus (k) are then plotted.

3. Additional load lines for the incremental values of weight are then drawn on the basis of the subgrade modulus curves already established.

4. The permanent scale for the rigid-pavement thickness is then placed. Lines for other than 5,000 coverages are established based on the aircraft pass-to-coverage ratio.

The ACN/PCN system (Section 7.10) as referenced in ICAO Annex 14, "Aerodromes," Fourth Edition, July 2004, provides a standardized international airplane/pavement rating system replacing the various S, T, TT, LCN, AUW, ISWL, etc., rating systems used
throughout the world. ACN is the Aircraft Classification Number and PCN is the Pavement Classification Number. An aircraft having an ACN equal to or less than the PCN can operate on the pavement subject to any limitation on the tire pressure. Numerically, the ACN is two times the derived single-wheel load expressed in thousands of kilograms, where the derived single wheel load is defined as the load on a single tire inflated to 181 psi (1.25 MPa) that would have the same pavement requirements as the aircraft. Computationally, the ACN/PCN system uses the PCA program PDILB for rigid pavements and S-77-1 for flexible pavements to calculate ACN values. The method of pavement evaluation is left up to the airport with the results of their evaluation presented as follows:

<table>
<thead>
<tr>
<th>PCN</th>
<th>PAVEMENT TYPE</th>
<th>SUBGRADE CATEGORY</th>
<th>TIRE PRESSURE CATEGORY</th>
<th>EVALUATION METHOD</th>

</tbody>
</table>

Section 7.10.1 through 7.10.3 shows the aircraft ACN values for flexible pavements. The four subgrade categories are:

- Code A - High Strength - CBR 15
- Code B - Medium Strength - CBR 10
- Code C - Low Strength - CBR 6
- Code D - Ultra Low Strength - CBR 3

Section 7.10.4 through 7.10.6 shows the aircraft ACN values for rigid pavements. The four subgrade categories are:

- Code A - High Strength, \( k = 550 \text{ pci (150 MN/m}^3)\)
- Code B - Medium Strength, \( k = 300 \text{ pci (80 MN/m}^3)\)
- Code C - Low Strength, \( k = 150 \text{ pci (40 MN/m}^3)\)
- Code D - Ultra Low Strength, \( k = 75 \text{ pci (20 MN/m}^3)\)

7.4 LANDING GEAR LOADING ON PAVEMENT

7.4.1 Landing Gear Loading on Pavement: Model 777-200LR
7.4.2 Landing Gear Loading on Pavement: Model 777-300ER
7.4.3 Landing Gear Loading on Pavement: Model 777F
7.5 FLEXIBLE PAVEMENT REQUIREMENTS - U.S. ARMY CORPS OF ENGINEERS METHOD S-77-1

The following flexible-pavement design chart presents the data of six incremental main-gear loads at the minimum tire pressure required at the maximum design taxi weight.

In the example shown in Section 7.5.1, for a CBR of 25 and an annual departure level of 6,000, the required flexible pavement thickness for a 777-200LR airplane with a main gear loading of 550,000 pounds is 13.8 inches. Likewise, the required flexible pavement thickness for the 777-300ER under the same conditions, is 13.9 inches as shown in Section 7.5.2.

The line showing 10,000 coverages is used for ACN calculations (see Section 7.10).

7.6 FLEXIBLE PAVEMENT REQUIREMENTS - LCN CONVERSION

To determine the airplane weight that can be accommodated on a particular flexible pavement, both the Load Classification Number (LCN) of the pavement and the thickness must be known.

In the example shown in Section 7.6.1, flexible pavement thickness is shown at 30 inches with an LCN of 94. For these conditions, the maximum allowable weight on the main landing gear is 500,000 lb for a 777-200LR airplane with 218 psi main gear tires.
Likewise, in the example shown in Section 7.6.2, the flexible pavement thickness is shown at 24 inches and the LCN is 88. For these conditions, the maximum allowable weight on the main landing gear is 550,000 lb for a 777-300ER airplane with 221 psi main gear tires.

Note: If the resultant aircraft LCN is not more that 10% above the published pavement LCN, the bearing strength of the pavement can be considered sufficient for unlimited use by the airplane. The figure 10% has been chosen as representing the lowest degree of variation in LCN that is significant (reference: ICAO Aerodrome Manual, Part 2, "Aerodrome Physical Characteristics," Chapter 4, Paragraph 4.1.5.7v, 2nd Edition dated 1965).

7.6.2 Flexible Pavement Requirements - LCN Method: Model 777-300ER
7.7 RIGID PAVEMENT REQUIREMENTS - PORTLAND CEMENT ASSOCIATION DESIGN METHOD

The following rigid pavement design chart presents the data for six incremental main gear loads at the minimum tire pressure required at the maximum design taxi weight.

In the example shown in Section 7.7.1, for an allowable working stress of 550 psi, and a subgrade strength (k) of 300, the required rigid pavement thickness is 11.1 inches for a 777-200LR airplane with a main gear load of 650,000 lb. Likewise, for the same pavement conditions, the required pavement thickness for a 777-300ER airplane with a main gear load of 650,000 lb is 11.0 inches as shown in Section 7.7.2.

7.8 RIGID PAVEMENT REQUIREMENTS - LCN CONVERSION

To determine the airplane weight that can be accommodated on a particular rigid pavement, both the LCN of the pavement and the radius of relative stiffness (l) of the pavement must be known.

In the examples shown in Section 7.8.2 for a rigid pavement with a radius of relative stiffness of 47 with an LCN of 91, and 7.8.3 for a rigid pavement with a radius of relative stiffness of 47 with an LCN of 87, the apparent maximum allowable weight permissible on the main landing gear is 600,000 lb (272,155 kg) for an airplane with 221-psi (15.54 kg/cm²) main tires.

Note: If the resultant aircraft LCN is not more that 10% above the published pavement LCN, the bearing strength of the pavement can be considered sufficient for unlimited use by the airplane. The figure 10% has been chosen as representing the lowest degree of variation in LCN that is significant (reference: ICAO Aerodrome Design Manual, Part 2, "Aerodrome Physical Characteristics," Chapter 4, Paragraph 4.1.5.7v, 2nd Edition dated 1965).
### Radius of Relative Stiffness (Reference: Portland Cement Association)

**RADIUS OF RELATIVE STIFFNESS (l)**

\[ l = \sqrt[4]{\frac{4Ed^3}{12(1-\mu^2)k}} = 24.1652 \sqrt[4]{\frac{d^3}{k}} \]

7.8.2 Rigid Pavement Requirements - LCN Conversion: Model 777-200LR, 777
7.8.3  Rigid Pavement Requirements - LCN Conversion: Model 777-300ER
7.9 RIGID PAVEMENT REQUIREMENTS - FAA DESIGN METHOD

The following rigid-pavement design chart presents data on six incremental main gear loads at the minimum tire pressure required at the maximum design taxi weight.

In the example shown, for a pavement flexural strength of 700 psi, a subgrade strength of $k = 300$, and an annual departure level of 3,000, the required pavement thickness for a 777-200LR or 777-300ER airplane with a main gear load of 650,00 lb is 10.8 inches.
7.9.1 Rigid Pavement Requirements: Model 777-200LR, -300ER, 777F
7.10 ACN/PCN REPORTING SYSTEM - FLEXIBLE AND RIGID PAVEMENTS

To determine the ACN of an aircraft on flexible or rigid pavement, both the aircraft gross weight and the subgrade strength category must be known. The chart in Section 7.10.1 shows that for a 777F aircraft with gross weight of 700,000 lb on a medium strength subgrade (Code B), the flexible pavement ACN is 60. In Section 7.10.4, for the same aircraft weight and medium subgrade strength (Code B), the rigid pavement ACN is 70.

The following table provides ACN data in tabular format similar to the one used by ICAO in the “Aerodrome Design Manual Part 3, Pavements.” If the ACN for an intermediate weight between taxi weight and empty fuel weight of the aircraft is required, Figures 7.10.1 through 7.10.6 should be consulted.

(1) Minimum weight used solely as a baseline for ACN curve generation.
7.10.1 Aircraft Classification Number - Flexible Pavement: Model 777F

[Diagram with notes and axes labeled for aircraft classification number and aircraft gross weight]
7.10.2 Aircraft Classification Number - Flexible Pavement: Model 777-200LR
7.10.3 Aircraft Classification Number - Flexible Pavement: Model 777-300ER
7.10.4 Aircraft Classification Number - Rigid Pavement: Model 777F
7.10.5 Aircraft Classification Number - Rigid Pavement: Model 777-200LR
7.10.6 Aircraft Classification Number - Rigid Pavement: Model 777-300ER

Diagram showing aircraft classification number for rigid pavement with Model 777-300ER specifications.
8.0 FUTURE 777 DERIVATIVE AIRPLANES

Several derivatives are being studied to provide additional capabilities of the 777 family of airplanes. Future growth versions could require additional passenger capacity or increased range or both. Whether these growth versions could be built would depend entirely on airline requirements. In any event, impact on airport facilities will be a consideration in the configuration and design.
9.0 SCALED 777 DRAWINGS

The drawings in the following pages show airplane plan view drawings, drawn to approximate scale as noted. The drawings may not come out to exact scale when printed or copied from this document. Printing scale should be adjusted when attempting to reproduce these drawings. Three-view drawing files of the 777-200LR, 777-300ER and 777-Freighter, along with other Boeing airplane models, can be downloaded from the following website:
