Receipt
The samples were received on 3/27/2020 2:15 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 6 coolers at receipt time were 0.2º C, 0.3º C, 0.9º C, 1.4º C, 2.1º C and 3.3º C.

RAD
Method 900.0: Gross Alpha Beta Prep Batch 160-466721

The matrix spike recovery (MS, 53%) was outside the lower limit (60%). Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Outfall002_20200327_Comp (440-263721-1), Outfall002_20200327_Comp (440-263721-1[MS]), Outfall002_20200327_Comp (440-263721-1[MSD]), (LCS 160-466721/2-A), (LCSB 160-466721/3-A), (MB 160-466721/1-A), (440-263721-S-1-I DU), (440-263721-S-1-G MSBT) and (440-263721-S-1-H MSBTD)

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Method 901.1: Gamma Prep Batch 160-466487
Many isotopes requested for analysis do not have any gamma emissions, or the gamma emissions they do have are very poor. Often, such analytes are reported by gamma spectrometry assuming secular equilibrium with a longer-lived parent. The client should ensure that such inference is acceptable for their sample based upon process knowledge. The following assumptions were made for this report:

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklist, and the chain-of-custody (COC) provided by the laboratories for sample delivery group (SDG) 440-262968-1:

- The laboratories received the sample in this SDG on ice and within the temperature limits of ≤6 degrees Celsius (°C) and >0°C.
- The laboratories received the sample containers intact and properly preserved, as applicable.
- Field and laboratory personnel signed and dated the COCs.
- The sample was submitted to Enthalpy Analytical for analysis by Method 9221F.
- According to the Login Sample Receipt Checklists, custody seals were absent on the coolers upon receipt at both laboratories; however, no evidence of tampering was noted.
- The case narrative indicated that two of three vials for the VOC analysis of the trip blank were received with headspace. A third vial without headspace remained for analysis. No qualification was necessary.

Comments
No additional comments.

Receipt
The samples were received on 3/13/2020 3:30 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 4 coolers at receipt time were 0.6º C, 0.7º C, 1.0º C and 1.1º C.

Receipt Exceptions
The following sample was received with headspace in the sample container: TB-20200313 (440-262968-3). Received for TB- two VOA vials HCL and one VOA vial UP with headspace more than 6 mm.

GC/MS VOA
Method 624.1: The continuing calibration verification (CCV) associated with batch 440-600639 recovered above the upper control limit for Chloromethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Subcontract non-Sister
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Methods 1664A: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 440-601885 and analytical batch 440-601925. The laboratory control sample (LCS) was performed in duplicate to provide precision data for this batch. Method 1664A/B.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Subcontract Work
Method 9221F- E. Coli: This method was subcontracted to Enthalpy Analytical - Barkley. The subcontract laboratory certification is different from that of the facility issuing the final report.

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklists and the chains-of-custody (COCs) provided by the laboratories for sample delivery group (SDG) 440-263044-1:

- The laboratories received the sample in this SDG on ice and within the temperature limits of ≤6 degrees Celsius (°C) and >0°C.
- The laboratories received the sample containers intact and properly preserved, as applicable.
- Field and/or laboratory personnel signed and dated the original and transfer COCs.
- According to the Login Sample Receipt Checklist, custody seals were absent on the coolers upon receipt at TA-Irvine. No evidence of tampering was noted. The Login Sample Receipt Checklist indicated a custody seal was present (but with no number) upon receipt at TA-Sacramento.
- The case narrative indicated the site sample was received in wide-mouth amber glass bottles, and slightly less sample volume (968 milliliters) was available for extraction.

III. EPA METHOD 1613B — DIOXIN/FURANS

E. Wessling of MEC[X] reviewed the SDG on April 16, 2020.

The sample listed in Table 1 for this analysis was validated based on the guidelines outlined in the *MEC[X] Data Validation Procedure for Dioxins and Furans* (DVP-19, Rev. 0), *USEPA Method 1613B* and the *National Functional Guidelines Chlorinated Dioxin/Furan Data Review* (2011).

III.1. HOLDING TIMES

Extraction and analytical holding times were met. The water sample was extracted and analyzed within one year of collection.

III.2. INSTRUMENT PERFORMANCE

Instrument performance criteria were not evaluated during a Stage II validation.

III.3. CALIBRATION

Calibration criteria were not evaluated during a Stage II validation.

III.4. QUALITY CONTROL SAMPLES

III.4.1. *METHOD BLANKS*

The method blank had detects above the EDL and below the reporting limit (RL) for isomers 1,2,3,4,6,7,8-HpCDD, 1,2,3,4,7,8-HxCDD, 1,2,3,7,8,9-HxCDF, OCDD and OCDF, and for totals HxCDD, HxCDF and HpCDD. The sample results for the isomer method blank contaminants detected below the RL were qualified as nondetects (U) at the level of contamination. The reviewer compared concentrations comprising the isomer to those in the sample totals. Sample totals were qualified as estimated (J), as only a portion of the total was determined to be method blank contamination.

III.4.2. *LABORATORY CONTROL SAMPLES*

LCS recoveries were within the acceptance criteria listed in Table 6 of Method 1613B.

III.5. FIELD QC SAMPLES

MEC[X] evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC[X] used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

III.5.1. *FIELD BLANKS AND EQUIPMENT BLANKS*

Field blank or equipment blank samples were not identified for this SDG.

III.5.2. *FIELD DUPLICATES*

Field duplicate samples were not identified in this SDG.

III.6. INTERNAL STANDARDS PERFORMANCE

The labeled standard recoveries were not evaluated during a Stage II validation.

III.7. COMPOUND IDENTIFICATION

Compound identification was not evaluated during a Stage II validation. With the exception of estimated maximum possible concentrations (EMPCs), detected compounds met the ion abundance ratio, retention time window and signal-to-noise ratio criteria for identification. The laboratory analyzed for polychlorinated dioxins/furans by EPA Method 1613B. Second-column confirmation analysis for isomer 2,3,7,8-TCDF was not required, as 2,3,7,8-TCDF was not detected in the initial analysis of the sample.

III.8. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantitation was not evaluated during a Stage II validation. The laboratory calculated and reported compound-specific detection limits. Detects between the EDL and the RL were qualified as estimated (J) and coded with DNQ to comply with the NPDES permit. Nondetects are valid to the EDL. Per client request, results below the EDL meeting retention time and signal to noise (S/N) criteria were to be reported; however, this sample had no reported detects below the EDL.

As noted in the case narrative, RLs and EDLs were slightly elevated due to somewhat limited sample volume. Rather than approximately 1000 milliliters (ml), a 968 ml sample volume was available for extraction.

Isomers previously qualified as method blank contamination were not further qualified as EMPCs. Isomers 1,2,3,4,7,8,9-HpCDF, 1,2,3,7,8,9-HxCDD and 1,2,3,7,8-PeCDF reported as EMPCs were qualified as estimated nondetects (UJ) at the level of the EMPC. The totals, including HpCDD included one or more EMPC peaks and were therefore qualified as estimated (J).

Receipt
The samples were received on 3/14/2020 5:30 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 3 coolers at receipt time were 0.6º C, 0.8º C and 0.9º C.

GC/MS Semi VOA
Method 625.1: The laboratory control sample (LCS) and/or laboratory control sample duplicate (LCSD) for preparation batch 440-601122 and 440-601122 and analytical batch 440-601579 recovered below control limits for the following analyte(s): Benzidine and Hexachlorocyclopentadiene. These analytes have been identified as poor performing analytes when analyzed using this method; therefore, re-extraction/re-analysis was not performed. The results for these analytes may be biased low.

Method 625.1: The matrix spike/matrix spike duplicate (MS/MSD) for preparation batch 440-601122 and analytical batch 440-601579 exceeded control limits for the following analyte(s): 3,3'-Dichlorobenzidine, Hexachlorocyclopentadiene and Benzidine. Note that this analyte is a known poor performer when analyzed using this method.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

HPLC/IC
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

GC Semi VOA
Method 608.3: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 440-601089 and analytical batch 440-601412. The laboratory control sample (LCS) was performed in duplicate to provide precision data for this batch: (LCS 440-601089/5-A)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Dioxin
Method 1613B: EPA Method 1613B specifies a +/- 15 second retention time difference between the recovery standard in the initial calibration (ICAL) and the continuing calibration verification (CCV). The 13C-1,2,3,4-TCDD associated with the following samples run on instrument DFS 1 exceeded this criteria: Outfall008_20200314_Comp (440-263044-1), (CCV 320-366401/17), (LCS 320-365527/2-A) and (MB 320-365527/1-A). This retention time shift is due to normal and reasonable column maintenance and does not affect the instrument chromatography resolution, sensitivity, or identification of target analytes. System retention times have been updated for proper analyte identification.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method FILTRATION: The following samples requested dissolved metals and were not filtered in the field: Outfall008_20200314_Comp_F (440-263044-2). These samples were filtered and preserved upon receipt to the laboratory.

03/16/20
2.5mL of HNO3
HNO3 Lot # 0000234822

Method 200.7 Rev 4.4: The continuing calibration blank (CCB) for analytical batch 440-601118 contained Calcium above the Method detection limit (MDL). All reported samples associated with this CCB were either ND for this analyte or contained this analyte at a concentration greater than 10X the value found in the CCB; therefore, re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Subcontract non-Sister
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 625: A LCSD was added due to about 30 mL of the MS spilling during the extraction procedure. The LCSD was added to provide precision data for the batch.

Outfall008_20200314_Comp (440-263044-1)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Dioxin Prep
Method 1613B: Elevated reporting limits are provided for the following sample due to insufficient sample provided for 1613B_Sox_Sep_P preparation/analysis: Samples Outfall008_20200314_Comp (440-263044-1) were received in wide-mouth amber glass bottles.

preparation batch 320-365527

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Notes and Definitions

Item	Definition
M-02	Due to the nature of matrix interferences, sample was diluted prior to preparation. The MDL and MRL were raised due to the dilution.
QC-2	This QC sample was reanalyzed to complement samples that require re-analysis on different date. See analysis date.
S-GC	Surrogate recovery outside of control limits due to a possible matrix effect . The data was accepted based on valid recovery of the remaining surrogate.
% Rec	Percent Recovery
Dil	Dilution
dry	Sample results reported on a dry weight basis
MDA	Minimum Detectable Activity
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
NR	Not Reportable
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.
TIC	Tentatively Identified Compound (TIC) using mass spectrometry. The reported concentration is relative concentration based on the nearest internal standard. If the library search produces no matches at, or above 85%, the compound is reported as unknown.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

An Absence of Total Coliform meets the drinking water standards as established by the California State Water Resources Control Board (SWRCB)

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

The samples were received on 3/14/2020 5:30 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 3 coolers at receipt time were 0.6º C, 0.8º C and 0.9º C.

RAD
Method 900.0: Gross Alpha/Beta Prep Batch 160-465288

The gross alpha detection goal was not met for the following samples due to a reduction of the sample size attributed to high residual mass. Analytical results are reported with the MDC achieved.
(440-263045-Q-1-E) and (440-263045-Q-1-J DU).

Method 900.0: Gross Alpha/Beta Prep Batch 160-465288
Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Outfall008_20200314_Comp (440-263044-1), (LCS 160-465288/2-A), (LCSB 160-465288/3-A), (MB 160-465288/1-A), (440-263045-Q-1-E), (440-263045-Q-1-J DU), (440-263045-Q-1-F MS), (440-263045-Q-1-H MSBT), (440-263045-Q-1-I MSBTD) and (440-263045-Q-1-G MSD)

Method 901.1: Gamma Prep Batch 160-464923
Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Many isotopes requested for analysis do not have any gamma emissions, or the gamma emissions they do have are very poor. Often, such analytes are reported by gamma spectrometry assuming secular equilibrium with a longer-lived parent. The client should ensure that such inference is acceptable for their sample based upon process knowledge. The following assumptions were made for this report:

Method 906.0: LSC Tritium Prep Batch 160-466637

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Method 906.0: LSC Tritium Prep Batch 160-466637

In an initial count, the subtraction background (BKG) was elevated, and several samples exhibited high negative results. The samples were re-aliquotted from the remaining distillate and recounted, exhibiting a normal BKG value. The MS and MSD were inadvertently “post spiked” during the realiquot, resulting in a spike value of 1100% of the normal amount (the original spike is distributed over the 100 mL aliquot, whereas the post spike only in the 10 mL portion measured). The MS and MSD recoveries are in limits in the re-aliquot, and they were within limits in the prior count. The laboratory does not believe this adversely affects the data.

Method A-01-R: Isotopic Uranium Prep Batch 160-466005
Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

III. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklists and the chains-of-custody (COCs) provided by the laboratories for sample delivery group (SDG) 440-263515-1:

- The laboratories received the sample in this SDG on ice and within the temperature limits of ≤6 degrees Celsius (°C) and >0°C.
- The laboratories received the sample containers intact and properly preserved, as applicable.
- Field and/or laboratory personnel signed and dated the original and transfer COCs.
- According to the Login Sample Receipt Checklist, custody seals were absent on the coolers upon receipt at TA-Irvine. No evidence of tampering was noted. The Login Sample Receipt Checklist indicated a custody seal was present (but with no number) upon receipt at TA-Sacramento.
- The case narrative indicated the site sample was received in wide-mouth amber glass bottles, and slightly less sample volume (965 milliliters) was available for extraction.

III. EPA METHOD 1613B — DIOXIN/FURANS

E. Wessling of MEC[X] reviewed the SDG on April 16, 2020.

The sample listed in Table 1 for this analysis was validated based on the guidelines outlined in the *MEC[X] Data Validation Procedure for Dioxins and Furans* (DVP-19, Rev. 0), *USEPA Method 1613B* and the *National Functional Guidelines Chlorinated Dioxin/Furan Data Review* (2011).

III.1. HOLDING TIMES

Extraction and analytical holding times were met. The water sample was extracted and analyzed within one year of collection.

III.2. INSTRUMENT PERFORMANCE

Instrument performance criteria were not evaluated during a Stage II validation.

III.3. CALIBRATION

Calibration criteria were not evaluated during a Stage II validation.

III.4. QUALITY CONTROL SAMPLES

III.4.1. *METHOD BLANKS*

The method blank had detects above the EDL and below the reporting limit (RL) for isomers 1,2,3,4,6,7,8-HpCDD, 1,2,3,4,6,7,8-HpCDF, OCDD and OCDF, and for totals TCDD, HpCDD and HpCDF. The sample results for the isomer method blank contaminants detected below the RL were qualified as nondetects (U) at the level of contamination. The reviewer compared concentrations comprising the isomer to those in the sample totals. The total for HpCDF was comprised of the peak which was qualified for blank contamination; therefore, the total HpCDF was qualified as a nondetect (U). The remaining sample totals were qualified as estimated (J), as only a portion of the total was determined to be method blank contamination.

III.4.2. *LABORATORY CONTROL SAMPLES*

LCS recoveries were within the acceptance criteria listed in Table 6 of Method 1613B.

III.5. FIELD QC SAMPLES

MEC[X] evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC[X] used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

III.5.1. *FIELD BLANKS AND EQUIPMENT BLANKS*

Field blank or equipment blank samples were not identified for this SDG.

III.5.2. *FIELD DUPLICATES*

Field duplicate samples were not identified in this SDG.

III.6. INTERNAL STANDARDS PERFORMANCE

The labeled standard recoveries were not evaluated during a Stage II validation.

III.7. COMPOUND IDENTIFICATION

Compound identification was not evaluated during a Stage II validation. With the exception of estimated maximum possible concentrations (EMPCs), detected compounds met the ion abundance ratio, retention time window and signal-to-noise ratio criteria for identification. The laboratory analyzed for polychlorinated dioxins/furans by EPA Method 1613B. Second-column confirmation analysis for isomer 2,3,7,8-TCDF was not required, as 2,3,7,8-TCDF was not detected in the initial analysis of the sample.

III.8. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantitation was not evaluated during a Stage II validation. The laboratory calculated and reported compound-specific detection limits. Detects between the EDL and the RL were qualified as estimated (J) and coded with DNQ to comply with the NPDES permit. Nondetects are valid to the EDL. Per client request, results below the EDL meeting retention time and signal to noise (S/N) criteria were to be reported; however, this sample had no reported detects below the EDL.

As noted in the case narrative, RLs and EDLs were slightly elevated due to somewhat limited sample volume. Rather than approximately 1000 milliliters (ml), a 965 ml sample volume was available for extraction.

Isomers and total HpCDF previously qualified as method blank contamination were not further qualified as EMPCs. Total HpDCD included one or more EMPC peaks and were therefore qualified as estimated (J).

Receipt
The samples were received on 3/24/2020 12:50 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 6 coolers at receipt time were 0.1º C, 0.3º C, 1.3º C, 1.6º C, 1.7º C and 2.3º C.

HPLC/IC
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Dioxin
Method 1613B: EPA Method 1613B specifies a +/- 15 second retention time difference between the recovery standard in the initial calibration (ICAL) and the continuing calibration verification (CCV). The 13C-1,2,3,4-TCDD and 13C-1,2,3,7,8,9-HxCDD associated with the following samples run on instrument 10D5 exceeded this criteria: Outfall008_20200324_Comp (440-263515-1), (CCV 320-368420/27), (LCS 320-367895/2-A) and (MB 320-367895/1-A). This retention time shift is due to normal and reasonable column maintenance and does not affect the instrument chromatography resolution, sensitivity, or identification of target analytes. System retention times have been updated for proper analyte identification.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method FILTRATION: The following sample requested dissolved metals and was not filtered in the field: Outfall008_20200324_Comp_F (440-263515-2). This was filtered and preserved upon receipt to the laboratory.

03/24/20
2.5mL of HNO3
HNO3 Lot # 0000234822

Method 245.1: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 440-602138 and 440-602353 and analytical batch 440-602527 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 200.8: The method blank for preparation batch 440-602306 and analytical batch 440-602534 contained Copper above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Subcontract non-Sister
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Dioxin Prep
Method 1613B: Elevated reporting limits are provided for the following sample due to insufficient sample provided for 1613B_Sox_Sep_P preparation/analysis: Sample Outfall008_20200324_Comp (440-263515-1) was received in a wide-mouth amber glass bottle.

Receipt
The samples were received on 3/24/2020 12:50 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 6 coolers at receipt time were 0.1º C, 0.3º C, 1.3º C, 1.6º C, 1.7º C and 2.3º C.

RAD
Method 900.0: Gross Alpha/Beta Prep Batch 160-465900

The laboratory control sample (LCS, 68%) failed below the lower limit (75%). The lab reached out to the client who requested the data be reported.

(LCS 160-465900/2-A)

Method 900.0: Gross Alpha/Beta Prep Batch 160-465900

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Method 901.1: Gamma Prep Batch 160-465827
Many isotopes requested for analysis do not have any gamma emissions, or the gamma emissions they do have are very poor. Often, such analytes are reported by gamma spectrometry assuming secular equilibrium with a longer-lived parent. The client should ensure that such inference is acceptable for their sample based upon process knowledge. The following assumptions were made for this report:

Method 906.0: LSC Tritium Prep Batch 160-466637

In an initial count, the subtraction background (BKG) was elevated, and several samples exhibited high negative results. The samples were re-aliquotted from the remaining distillate and recounted, exhibiting a normal BKG value. The MS and MSD were inadvertently “post spiked” during the realiquot, resulting in a spike value of 1100% of the normal amount (the original spike is distributed over the 100 mL

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklists, and the chains-of-custody (COC) provided by the laboratories for sample delivery group (SDG) 440-262957-1:

- The laboratories received the sample in this SDG on ice and within the temperature limits of ≤6 degrees Celsius (°C) and >0°C.
- The laboratories received the sample containers intact and properly preserved, as applicable.
- Field and laboratory personnel signed and dated the COCs.
- The sample was submitted to Enthalpy Analytical for analysis by Method 9221F.
- According to the Login Sample Receipt Checklists, custody seals were absent on the coolers upon receipt at both laboratories; however, no evidence of tampering was noted.
- The case narrative indicated that two of three vials for the VOC analysis of the trip blank were received with headspace. A third vial without headspace remained for analysis. No qualification was necessary.

III. EPA METHOD 624.1—VOLATILE ORGANIC COMPOUNDS (VOCS)

E. Wessling of MEC[X] reviewed the SDG on April 7, 2020

The sample listed in Table 1 for this analysis was validated based on the guidelines outlined in the *MEC[X] Data Validation Procedure for Volatile Organics (DVP-2, Rev. 2), EPA Method 624.1* and the *National Functional Guidelines for Superfund Organic Methods Data Review* (2017).

III.1. HOLDING TIMES

Analytical holding times were met. The preserved water site sample and trip blank were analyzed within 14 days of collection.

III.2. GC/MS TUNING AND CALIBRATION

The BFB tunes were not evaluated in a Level II validation.

Calibration criteria were not evaluated in a Level II validation.

III.3. QUALITY CONTROL SAMPLES

III.3.1. *METHOD BLANKS*

Target compounds were not detected in the method blanks above the MDL.

III.3.2. *LABORATORY CONTROL SAMPLES*

LCS recoveries were within the laboratory control limits.

III.3.3. *SURROGATE RECOVERY*

Surrogate recoveries were within the laboratory control limits.

III.3.4. *MATRIX SPIKE/MATRIX SPIKE DUPLICATE*

MS/MSD analyses were performed on the site sample in this SDG. The RPD for 2-chloroethyl vinyl ether was above the RPD limit of 30%; however, as both recoveries were within laboratory QC limits and the sample was nondetect, no qualification was deemed necessary by the reviewer. The remaining recoveries and RPDs were within QC limits.

III.4. FIELD QC SAMPLES

MEC[X] evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC[X] used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below.

III.4.1. *TRIP BLANKS*

Sample TB-20200313 was identified as the trip blank associated with the site sample in this SDG. The trip blank had no target compound detects above the MDL.

III.4.2. *FIELD BLANKS AND EQUIPMENT BLANKS*

Field blank or equipment blank samples were not identified for this SDG.

III.4.3. *FIELD DUPLICATES*

Field duplicate samples were not identified in this SDG.

III.5. INTERNAL STANDARDS PERFORMANCE

The internal standard retention times and area counts were not evaluated in a Level II validation.

III.6. COMPOUND IDENTIFICATION

Compound identification was not evaluated in a Level II validation. The laboratory analyzed for 38 target compounds by Method 624.1.

III.7. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantification was not evaluated in a Level II validation. The reporting limits were supported by the low point of the initial calibration and the laboratory MDLs. Reported nondetects are valid to the reporting limit.

III.8. TENTATIVELY IDENTIFIED COMPOUNDS

The laboratory did not report TICs for this SDG.

III.9. SYSTEM PERFORMANCE

Review of the raw data not performed in a Level II validation.

IV. VARIOUS METHODS — GENERAL CHEMISTRY

M. Hilchey of MEC^X reviewed the SDG on April 6, 2020.

The sample listed in Table 1 for these analyses was validated based on the guidelines outlined in the *MEC^X Data Validation Procedure for General Minerals (DVP-6, Rev. 1), EPA Method 1664, Standard Methods for the Examination of Water and Wastewater 9221F* and the *National Functional Guidelines for Inorganic Superfund Data Review* (2014).

IV.1. HOLDING TIMES

The QAPP holding times, as listed below, were met.

- 28 days for Oil and Grease (HEM, Method 1664)
- 8 hours per COC for *E.Coli* (Method 9221F)

IV.2. CALIBRATION

Instrument calibration review is not performed at Level II validation.

IV.3. QUALITY CONTROL SAMPLES

IV.3.1. *METHOD BLANKS*

The method blank had no detections for Method 1664. The negative control sample was acceptable for the *E. Coli* analysis.

IV.3.2. *LABORATORY CONTROL SAMPLES*

Laboratory control sample and laboratory control sample duplicate recoveries were within the laboratory control limits for Method 1664. The presumptive test was analyzed with positive detects for *E. Coli*.

IV.3.3. *LABORATORY DUPLICATES*

Receipt
The samples were received on 3/13/2020 3:30 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 4 coolers at receipt time were 0.6º C, 0.7º C, 1.0º C and 1.1º C.

Receipt Exceptions
The following sample was received with headspace in the sample container: TB-20200313 (440-262957-3). Received two out of two voa vials TB HCL with headspace more than 6 ml .

GC/MS VOA
Method 624.1: The continuing calibration verification (CCV) associated with batch 440-600639 recovered above the upper control limit for Chloromethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Subcontract non-Sister
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Methods 1664A: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 440-601885 and analytical batch 440-601925. The laboratory control sample (LCS) was performed in duplicate to provide precision data for this batch. Method 1664A/B.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Subcontract Work
Method 9221F- E. Coli: This method was subcontracted to Enthalpy Analytical - Barkley. The subcontract laboratory certification is different from that of the facility issuing the final report.

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklists and the chains-of-custody (COCs) provided by the laboratories for sample delivery group (SDG) 440-263043-1:

- The laboratories received the sample in this SDG on ice and within the temperature limits of ≤6 degrees Celsius (°C) and >0°C.
- The laboratories received the sample containers intact and properly preserved, as applicable.
- Field and/or laboratory personnel signed and dated the original and transfer COCs.
- The sample was transferred from TA-Irvine to TA-Savannah for analysis of Method 1613B.
- According to the Login Sample Receipt Checklist, custody seals were absent on the coolers upon receipt at TA-Irvine. No evidence of tampering was noted. The Login Sample Receipt Checklist indicated a custody seal was present (but with no number) upon receipt at TA-Sacramento.
- The case narrative indicated the site sample was received in wide-mouth amber glass bottles, and slightly less sample volume (949 milliliters) was available for extraction.

III. EPA METHOD 1613B — DIOXIN/FURANS

E. Wessling of MEC[X] reviewed the SDG on April 16, 2020.

The sample listed in Table 1 for this analysis was validated based on the guidelines outlined in the *MEC[X] Data Validation Procedure for Dioxins and Furans* (DVP-19, Rev. 0), *USEPA Method 1613B* and the *National Functional Guidelines Chlorinated Dioxin/Furan Data Review* (2011).

III.1. HOLDING TIMES

Extraction and analytical holding times were met. The water sample was extracted and analyzed within one year of collection.

III.2. INSTRUMENT PERFORMANCE

Instrument performance criteria were not evaluated during a Stage II validation.

III.3. CALIBRATION

Calibration criteria were not evaluated during a Stage II validation.

III.4. QUALITY CONTROL SAMPLES

III.4.1. *METHOD BLANKS*

The method blank had detects above the EDL and below the reporting limit (RL) for isomers 1,2,3,4,6,7,8-HpCDD, 1,2,3,4,7,8-HxCDD, 1,2,3,7,8,9-HxCDF, OCDD and OCDF, and for totals HxCDD, HxCDF and HpCDD. The sample results for the isomer method blank contaminants detected below the RL were qualified as nondetects (U) at the level of contamination. The method blank concentration for OCDD was not sufficient to qualify the site sample. The reviewer compared concentrations comprising the isomer to those in the sample totals. Sample totals were qualified as estimated (J), as only a portion of the total was determined to be method blank contamination.

III.4.2. *LABORATORY CONTROL SAMPLES*

LCS recoveries were within the acceptance criteria listed in Table 6 of Method 1613B.

III.5. FIELD QC SAMPLES

MEC[X] evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC[X] used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

III.5.1. *FIELD BLANKS AND EQUIPMENT BLANKS*

Field blank or equipment blank samples were not identified for this SDG.

III.5.2. *FIELD DUPLICATES*

Field duplicate samples were not identified in this SDG.

III.6. INTERNAL STANDARDS PERFORMANCE

The labeled standard recoveries were not evaluated during a Stage II validation.

III.7. Compound Identification

Compound identification was not evaluated during a Stage II validation. With the exception of estimated maximum possible concentrations (EMPCs), detected compounds met the ion abundance ratio, retention time window and signal-to-noise ratio criteria for identification. The laboratory analyzed for polychlorinated dioxins/furans by EPA Method 1613B. Second-column confirmation analysis for isomer 2,3,7,8-TCDF was not required, as 2,3,7,8-TCDF was not detected in the initial analysis of the sample.

III.8. Compound Quantification and Reported Detection Limits

Compound quantitation was not evaluated during a Stage II validation. The laboratory calculated and reported compound-specific detection limits. Detects between the EDL and the RL were qualified as estimated (J) and coded with DNQ to comply with the NPDES permit. Nondetects are valid to the EDL. Per client request, results below the EDL meeting retention time and signal to noise (S/N) criteria were to be reported; however, this sample had no reported detects below the EDL.

As noted in the case narrative, RLs and EDLs were slightly elevated due to somewhat limited sample volume. Rather than approximately 1000 milliliters (ml), a 949 ml sample volume was available for extraction.

Isomers previously qualified as method blank contamination were not further qualified as EMPCs. Isomers 1,2,3,4,7,8,9-HpCDF and 2,3,4,7,8-PeCDF reported as EMPCs were qualified as estimated nondetects (UJ) at the level of the EMPC. The totals included one or more EMPC peaks and were therefore qualified as estimated (J).

IV. Methods 200.7 and 200.8— Metals

M. Hilchey of MEC^X reviewed the SDG on April 16, 2020.

The samples listed in Table 1 for these analyses were validated based on the guidelines outlined in the *MEC^X Data Validation Procedure for Metals (DVP-5, Rev. 2), EPA Methods 200.7 and 200.8* and the *National Functional Guidelines for Inorganic Method Data Review* (2017).

IV.1. Holding Times

The analytical holding time, six months for metals, was met. Sample OUTFALL009_20200314_COMP_F was filtered and preserved 44 hours after receipt, exceeding the COC requirement of filtration and preservation within 24 hours of receipt. All results for this sample were qualified as estimated (J for detects, UJ for nondetects).

IV.2. Calibration

Mass calibrations were within 0.1 atomic mass units of the true value and the %RSDs were ≤5%.

QAPP calibration criteria were met. A blank and two or three standards were used for calibration of ICP-AES target analytes and a blank and four standards were used for calibration of ICP-MS. The initial calibration r values were ≥0.995. CRQL recoveries were within the laboratory control limits of 50-150%. Initial calibration verification recoveries were within QAPP control limits of 95-105% for ICP-AES, and 90-110% for ICP-MS. Continuing calibration verification recoveries were within QAPP control limits of 90-110% for both methods.

IV.3. QUALITY CONTROL SAMPLES

IV.3.1. *METHOD BLANKS*

There were no target analyte detections in the method blanks or calibration blanks of sufficient concentration to warrant qualification of associated site sample results with the following exception. Selenium was reported in a CCB bracketing dissolved sample analyses at greater than MDL (0.509 µg/L). The associated result for dissolved selenium was a detected below the RL and was qualified as nondetect (U).

IV.3.2. *INTERFERENCE CHECK SAMPLES:*

ICP-AES and ICP-MS ICSAB recoveries were within the control limits of 80-120% or ±2× the reporting limit, whichever is greater. No interferents were present in the samples for ICP-AES analysis in concentrations comparable to those of the ICS; therefore, matrix interference was not suspected for ICP-AES. All ICP-MS ICSA results for non-spiked analytes were nondetect; therefore, interference was not evaluated for ICP-MS.

IV.3.3. *LABORATORY CONTROL SAMPLES*

Laboratory control sample recoveries (total and dissolved) were within the QAPP control limits of 85-115%.

IV.3.4. *LABORATORY DUPLICATES:*

Laboratory duplicate analyses were not performed on a sample in this SDG.

IV.3.5. *MATRIX SPIKE/MATRIX SPIKE DUPLICATE*

MS/MSD analyses were performed on sample OUTFALL009_20200314_COMP_F for dissolved metals by ICP-MS. Recoveries and the RPD met QAPP control limits of 70-130% and ≤20%, respectively. MS/MSD analyses were not performed on a sample in this SDG for the remaining analyses.

The laboratory did not perform post-digestion spike analyses.

IV.4. SERIAL DILUTION

Serial dilution analyses were not performed.

IV.5. INTERNAL STANDARDS PERFORMANCE

Sample internal standard recoveries were within 60-125% of the ICP-MS calibration blank.

IV.6. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Calculations were verified, and the sample results reported on the sample result summary were verified against the raw data. No transcription errors or calculation errors were noted. Results reported below the RL and above the MDL were qualified as estimated (J) and coded with a DNQ to comply with the NPDES permit reporting requirements. Nondetects are valid to the MDL.

IV.7. FIELD QC SAMPLES

MEC^X evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^X used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

IV.7.1. *FIELD BLANKS AND EQUIPMENT BLANKS*

Field blank or equipment blank samples were not identified for this SDG.

IV.7.2. *FIELD DUPLICATES*

There were no field duplicate samples identified for this SDG.

Receipt
The samples were received on 3/14/2020 5:30 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 4 coolers at receipt time were 0.8º C, 0.9º C, 1.7º C and 2.0º C.

GC/MS Semi VOA
Method 625.1: The laboratory control sample (LCS) and/or laboratory control sample duplicate (LCSD) for preparation batch 440-601122 and 440-601122 and analytical batch 440-601579 recovered below control limits for the following analyte(s): Benzidine and Hexachlorocyclopentadiene. These analytes have been identified as poor performing analytes when analyzed using this method; therefore, re-extraction/re-analysis was not performed. The results for these analytes may be biased low.

Method 625.1: The matrix spike/matrix spike duplicate (MS/MSD) for preparation batch 440-601122 and analytical batch 440-601579 exceeded control limits for the following analyte(s): 3,3'-Dichlorobenzidine, Hexachlorocyclopentadiene and Benzidine. Note that this analyte is a known poor performer when analyzed using this method.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

HPLC/IC
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

GC Semi VOA
Method 608.3: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 440-601089 and analytical batch 440-601412. The laboratory control sample (LCS) was performed in duplicate to provide precision data for this batch: (LCS 440-601089/5-A)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Dioxin
Method 1613B: EPA Method 1613B specifies a +/- 15 second retention time difference between the recovery standard in the initial calibration (ICAL) and the continuing calibration verification (CCV). The 13C-1,2,3,4-TCDD associated with the following samples run on instrument DFS 1 exceeded this criteria: Outfall009_20200314_Comp (440-263043-1), (CCV 320-366401/17), (LCS 320-365527/2-A) and (MB 320-365527/1-A). This retention time shift is due to normal and reasonable column maintenance and does not affect the instrument chromatography resolution, sensitivity, or identification of target analytes. System retention times have been updated for proper analyte identification.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method FILTRATION: The following samples requested dissolved metals and were not filtered in the field: Outfall009_20200314_Comp_F (440-263043-2). These samples were filtered and preserved upon receipt to the laboratory.

03/16/20
2.5mL of HNO3
HNO3 Lot # 0000234822

Method 200.8: The matrix spike / matrix spike duplicate (MS/MSD) recoveries of Thallium for preparation batch 440-600753 and analytical batch 440-601042 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected. The associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 200.7 Rev 4.4: The continuing calibration blank (CCB) for analytical batch 440-601118 contained Calcium above the Method

detection limit (MDL). All reported samples associated with this CCB were either ND for this analyte or contained this analyte at a concentration greater than 10X the value found in the CCB; therefore, re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Subcontract non-Sister
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 625: A LCSD was added due to about 30 mL of the MS spilling during the extraction procedure. The LCSD was added to provide precision data for the batch.

Outfall009_20200314_Comp (440-263043-1)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Dioxin Prep
Method 1613B: Elevated reporting limits are provided for the following sample due to insufficient sample provided for 1613B_Sox_Sep_P preparation/analysis: Samples Outfall009_20200314_Comp (440-263043-1) were received in wide-mouth amber glass bottles.

preparation batch 320-365527
Method: 1613B_Sox_Sep_P / 1613B
Matrix: Aqueous

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Notes and Definitions

Item	Definition
M-02	Due to the nature of matrix interferences, sample was diluted prior to preparation. The MDL and MRL were raised due to the dilution.
QC-2	This QC sample was reanalyzed to complement samples that require re-analysis on different date. See analysis date.
S-GC	Surrogate recovery outside of control limits due to a possible matrix effect . The data was accepted based on valid recovery of the remaining surrogate.
% Rec	Percent Recovery
Dil	Dilution
dry	Sample results reported on a dry weight basis
MDA	Minimum Detectable Activity
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
NR	Not Reportable
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.
TIC	Tentatively Identified Compound (TIC) using mass spectrometry. The reported concentration is relative concentration based on the nearest internal standard. If the library search produces no matches at, or above 85%, the compound is reported as unknown.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

An Absence of Total Coliform meets the drinking water standards as established by the California State Water Resources Control Board (SWRCB)

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

Receipt
The samples were received on 3/14/2020 5:30 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 4 coolers at receipt time were 0.8º C, 0.9º C, 1.7º C and 2.0º C.

RAD
Method 900.0: Gross Alpha/Beta Prep Batch 160-465288

The gross alpha detection goal was not met for the following samples due to a reduction of the sample size attributed to high residual mass. Analytical results are reported with the MDC achieved.
(440-263045-Q-1-E) and (440-263045-Q-1-J DU).

Method 900.0: Gross Alpha/Beta Prep Batch 160-465288
Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Method 901.1: Gamma Prep Batch 160-464923
Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Many isotopes requested for analysis do not have any gamma emissions, or the gamma emissions they do have are very poor. Often, such analytes are reported by gamma spectrometry assuming secular equilibrium with a longer-lived parent. The client should ensure that such inference is acceptable for their sample based upon process knowledge. The following assumptions were made for this report:

Method 906.0: LSC Tritium Prep Batch 160-466637

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Method 906.0: LSC Tritium Prep Batch 160-466637

In an initial count, the subtraction background (BKG) was elevated, and several samples exhibited high negative results. The samples were re-aliquotted from the remaining distillate and recounted, exhibiting a normal BKG value. The MS and MSD were inadvertently “post spiked” during the realiquot, resulting in a spike value of 1100% of the normal amount (the original spike is distributed over the 100 mL aliquot, whereas the post spike only in the 10 mL portion measured). The MS and MSD recoveries are in limits in the re-aliquot, and they were within limits in the prior count. The laboratory does not believe this adversely affects the data.

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Method A-01-R: Isotopic Uranium Prep Batch 160-466005
The Tracer recovery (17%) is below the lower QC limit (30%). There are sufficient tracer counts to keep the count uncertainty of the tracer <10% (2 sigma), the resolution is within limit, and the client RL was met.
Outfall009_20200314_Comp (440-263043-1)

Method A-01-R: Isotopic Uranium Prep Batch 160-466005

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklists and the chains-of-custody (COCs) provided by the laboratories for sample delivery group (SDG) 440-263409-1:

- The laboratories received the sample in this SDG on ice and within the temperature limits of ≤6 degrees Celsius (°C) and >0°C.
- The laboratories received the sample containers intact and properly preserved, as applicable.
- Field and/or laboratory personnel signed and dated the original and transfer COCs.
- According to the Login Sample Receipt Checklist, custody seals were absent on the coolers upon receipt at TA-Irvine. No evidence of tampering was noted. The Login Sample Receipt Checklist indicated a custody seal was present (but with no number) upon receipt at TA-Sacramento.
- The case narrative indicated the site sample was received in wide-mouth amber glass bottles, and slightly less sample volume (877 milliliters) was available for extraction.

III. EPA METHOD 1613B — DIOXIN/FURANS

E. Wessling of MEC[X] reviewed the SDG on April 16, 2020.

The sample listed in Table 1 for this analysis was validated based on the guidelines outlined in the *MEC[X] Data Validation Procedure for Dioxins and Furans* (DVP-19, Rev. 0), *USEPA Method 1613B* and the *National Functional Guidelines Chlorinated Dioxin/Furan Data Review* (2011).

III.1. HOLDING TIMES

Extraction and analytical holding times were met. The water sample was extracted and analyzed within one year of collection.

III.2. INSTRUMENT PERFORMANCE

Instrument performance criteria were not evaluated during a Stage II validation.

III.3. CALIBRATION

Calibration criteria were not evaluated during a Stage II validation.

III.4. QUALITY CONTROL SAMPLES

III.4.1. *METHOD BLANKS*

The method blank had detects above the EDL and below the reporting limit (RL) for isomers 1,2,3,4,6,7,8-HpCDD, 1,2,3,4,6,7,8-HpCDF, OCDD and OCDF, and for totals TCDD, HpCDD and HpCDF. The sample results for the isomer method blank contaminants detected below the RL were qualified as nondetects (U) at the level of contamination. The reviewer compared concentrations comprising the isomer to those in the sample totals. Sample totals were qualified as estimated (J), as only a portion of the total was determined to be method blank contamination.

III.4.2. *LABORATORY CONTROL SAMPLES*

LCS recoveries were within the acceptance criteria listed in Table 6 of Method 1613B.

III.5. FIELD QC SAMPLES

MEC[X] evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC[X] used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

III.5.1. *FIELD BLANKS AND EQUIPMENT BLANKS*

Field blank or equipment blank samples were not identified for this SDG.

III.5.2. *FIELD DUPLICATES*

Field duplicate samples were not identified in this SDG.

III.6. INTERNAL STANDARDS PERFORMANCE

The labeled standard recoveries were not evaluated during a Stage II validation.

III.7. Compound Identification

Compound identification was not evaluated during a Stage II validation. With the exception of estimated maximum possible concentrations (EMPCs), detected compounds met the ion abundance ratio, retention time window and signal-to-noise ratio criteria for identification. The laboratory analyzed for polychlorinated dioxins/furans by EPA Method 1613B. Second-column confirmation analysis for isomer 2,3,7,8-TCDF was not required, as 2,3,7,8-TCDF was not detected in the initial analysis of the sample.

III.8. Compound Quantification and Reported Detection Limits

Compound quantitation was not evaluated during a Stage II validation. The laboratory calculated and reported compound-specific detection limits. Detects between the EDL and the RL were qualified as estimated (J) and coded with DNQ to comply with the NPDES permit. Nondetects are valid to the EDL. Per client request, results below the EDL meeting retention time and signal to noise (S/N) criteria were to be reported; however, this sample had no reported detects below the EDL.

As noted in the case narrative, RLs and EDLs were slightly elevated due to somewhat limited sample volume. Rather than approximately 1000 milliliters (ml), an 877 ml sample volume was available for extraction.

Isomers previously qualified as method blank contamination were not further qualified as EMPCs. Isomers 1,2,3,4,7,8-HxCDD and 1,2,3,7,8,9-HxCDF reported as EMPCs were qualified as estimated nondetects (UJ) at the level of the EMPC. The totals included one or more EMPC peaks and were therefore qualified as estimated (J).

Receipt
The samples were received on 3/21/2020 1:15 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 6 coolers at receipt time were 0.2º C, 0.3º C, 1.5º C, 2.3º C, 2.8º C and 3.4º C.

HPLC/IC
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Dioxin
Method 1613B: EPA Method 1613B specifies a +/- 15 second retention time difference between the recovery standard in the initial calibration (ICAL) and the continuing calibration verification (CCV). The 13C-1,2,3,4-TCDD and 13C-1,2,3,7,8,9-HxCDD associated with the following samples run on instrument 10D5 exceeded this criteria: Outfall009_20200321_Comp (440-263409-1), (CCV 320-368420/27), (LCS 320-367895/2-A) and (MB 320-367895/1-A). This retention time shift is due to normal and reasonable column maintenance and does not affect the instrument chromatography resolution, sensitivity, or identification of target analytes. System retention times have been updated for proper analyte identification.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method FILTRATION: The following samples requested dissolved metals and were not filtered in the field: Outfall009_20200321_Comp_F (440-263409-2), Outfall009_20200321_Comp_F (440-263409-2[MS]) and Outfall009_20200321_Comp_F (440-263409-2[MSD]). These samples were filtered and preserved upon receipt to the laboratory.

03/23/20
2.5ml of HNO3
HNO3 Lot # 0000234822

Method 245.1: The initial calibration verification (ICV) result for batch 440-602330 was above the upper control limit. Sample results were non-detects, and have been reported as qualified data.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Subcontract non-Sister
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Many isotopes requested for analysis do not have any gamma emissions, or the gamma emissions they do have are very poor. Often, such analytes are reported by gamma spectrometry assuming secular equilibrium with a longer-lived parent. The client should ensure that such inference is acceptable for their sample based upon process knowledge. The following assumptions were made for this report:

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklists, and the chains-of-custody (COC) provided by the laboratories for sample delivery group (SDG) 440-258621-1:

- The laboratories received the sample in this SDG on ice and within the temperature limits of <6 degrees Celsius (°C) and >0°C.
- The laboratories received the sample containers intact and properly preserved, as applicable.
- Field and/or laboratory personnel signed and dated the appropriate original and transfer COCs.
- Corrections to the COC were initialed but not dated.
- The sample was submitted to Enthalpy Analytical for Method 9221F.
- According to the Login Sample Receipt Checklists, custody seals were absent on the coolers upon receipt at both laboratories; however, no evidence of tampering was noted.
- The case narrative indicated that the site sample for the 1613B analysis was received in a wide-mouth amber glass bottle, and slightly less sample volume (954 milliliters) was available for extraction.
- The laboratory noted in the narrative that due to multiple analyses, sample TB-20200107 was analyzed from a container with significant headspace, defined as a bubble six millimeters or greater in diameter. The sample was not included for data validation and the data was not included in the EDD. The site sample did not contain target compound detects and the TB headspace did not impact the site sample.

III.6. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantitation was verified. Review of the raw data did not indicate calculation or transcription errors. Results reported below the reporting limit were flagged as estimated (J) and coded DNQ to comply with the NPDES permit. Nondetects are valid to the reporting limit.

IV. EPA METHOD 624—VOLATILE ORGANIC COMPOUNDS (VOCS)

K. Zilis of MEC^X reviewed the SDG on March 6, 2020

The sample listed in Table 1 for this analysis was validated based on the guidelines outlined in the *MEC^X Data Validation Procedure for Volatile Organics (DVP-2, Rev. 2), EPA Method 624*, and the *National Functional Guidelines for Superfund Organic Methods Data Review* (2014).

IV.1. HOLDING TIMES

Analytical holding times were met. The preserved water site sample was analyzed within 14 days of collection, and the unpreserved trip blank and site sample aliquot for 2-chloroethylvinyl ether, acrolein, and acrylonitrile were analyzed within seven days of collection.

IV.2. GC/MS TUNING AND CALIBRATION

All calibration criteria were met. The initial calibration average RRFs and the ICV and continuing calibration RRFs were ≥0.05 for all applicable target compounds. The initial calibration %RSDs were ≤35%, or r^2 values ≥0.990. The second source ICV and all applicable CCV recoveries were within the method control limits.

IV.3. QUALITY CONTROL SAMPLES

IV.3.1. *METHOD BLANKS*

Target compounds were not detected in the method blanks above the MDL.

Qualifiers

A	See Report Comments.
B	Analyte was present in an associated method blank.
B1	Analyte was present in a sample and associated method blank greater than MDL but less than RDL.
BQ1	No valid test replicates. Sample Toxicity is possible. Best result was reported.
BQ2	No valid test replicates.
BQ3	No valid test replicates. Final DO is less than 1.0 mg/L. Result may be greater.
BQ4	Minor Dissolved Oxygen loss was observed in the blank water check, however, the LCS was within criteria, validating the batch.
BQ5	Minor Dissolved Oxygen loss was observed in the blank water check.
C	Possible laboratory contamination.
D	RPD was not within control limits. The sample data was reported without further clarification.
D1	Lesser amount of sample was used due to insufficient amount of sample supplied.
D2	Reporting limit is elevated due to sample matrix. Target analyte was not detected above the elevated reporting limit.

DW	Sample result is calculated on a dry weigh basis.
E	Concentration is estimated because it exceeds the quantification limits of the method.
I	The sample was read outside of the method required incubation period.
IR	Inconclusive Result. Legionella is present, however, there is possible non-specific agglutination preventing specific identification.
J	Reported value is estimated
L	The laboratory control sample (LCS) or laboratory control sample duplicate (LCSD) was out of control limits. Associated sample data was reported with qualifier.
L2	LCS did not meet recovery criteria, however, the MS and/or MSD met LCS recovery criteria, validating the batch.
M	The matrix spike (MS) or matrix spike duplicate (MSD) was not within control limits due to matrix interference. The associated LCS and/or LCSD was within control limits and the sample data was reported without further clarification.
M1	The matrix spike (MS) or matrix spike duplicate (MSD) is not within control limits due to matrix interference.
M2	The matrix spike (MS) or matrix spike duplicate (MSD) was not within control limits. The associated LCS and/or LCSD was not within control limits. Sample result is estimated.

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklists, and the chains-of-custody (COC) provided by the laboratories for sample delivery group (SDG) 440-258701-1:

- TA-Irvine received the samples in this SDG on ice and within the temperature limits of <6 degrees Celsius (°C) and >0°C. In the absence of a sample receipt form from ABC Laboratory, temperature upon receipt at that laboratory is unknown.
- The laboratories received the sample containers intact and properly preserved, as applicable.
- The sample was transferred from TA-Irvine to Aquatic Bioassay Consulting Laboratories (ABC) for Method EPA-821-R-02-013 chronic toxicity.
- Page 2 of the original COC to TA-Irvine Field did not have a relinquishment signature and date. The transfer COC from TA-Irvine to ABC Laboratory did not include a relinquishment signature and date. and laboratory personnel signed and dated the COC.
- According to the Login Sample Receipt Checklist for TA-Irvine, custody seals were absent on the coolers; however, no evidence of tampering was noted. In the absence of a sample receipt form from ABC, presence of custody seals in shipment to that laboratory is unknown.

III.1. HOLDING TIMES

The analytical holding time, six months for metals, was met. Sample OUTFALL018_20200108_COMP_F was filtered and preserved 38 hours after receipt, exceeding the COC requirement of filtration and preservation within 24 hours of receipt. All results for this sample were qualified as estimated (J for detects, UJ for nondetects).

III.2. CALIBRATION

Mass calibrations were within 0.1 atomic mass units of the true value and the %RSDs were ≤5%.

QAPP calibration criteria were met. A blank and two or three standards were used for calibration of ICP-AES target analytes, a blank and four standards were used for calibration of ICP-MS, and a blank and five standards were used for calibration of mercury. The initial calibration r values were ≥0.995. CRQL recoveries were within the laboratory control limits of 50-150%. The associated result for dissolved antimony was a detected below the RL and was qualified as nondetect (U). Although reported as nondetect in the summary form, mercury was reported in the raw data for a bracketing CCB at a negative value (-0.185 µg/L) greater than the absolute value of the MDL. VIII. VARIOUS METHODS — GENERAL CHEMISTRY

M. Hilchey of MEC^X reviewed the SDG on March 6, 2020.

The sample listed in Table 1 for these analyses was validated based on the guidelines outlined in the *MEC^X Data Validation Procedure for General Minerals (DVP-6, Rev. 1), EPA Methods 180.1, 218.6, 300.0 and EPA-821-R-02-013 , Standard Methods for the Examination of Water and Wastewater 2540C, 2540D, 4500-NH3-G and 4500-CN-E , 5210B, 5310B, 5540C* and the *National Functional Guidelines for Inorganic Superfund Data Review* (2014).

VIII.1. HOLDING TIMES

The QAPP holding times, as listed below, were met.

- 48 hours from collection for nitrate as N and nitrite as N (300.0); biological oxygen demand (5310B); turbidity (180.1); MBAS (5540C)
- 7 days for total dissolved solids (2540C); total suspended solids (2540D)
- 28 days for ammonia (4500-NH3-G); chloride, fluoride and sulfate (300.0); total organic carbon (5210B)
- 14 days for total cyanide (4500-CN-E)
- 36 hours from collection for Chronic Toxicity – *Selenastrum* (EPA-821-R-02-213)
- 24 hours from collection for hexavalent chromium (218.6)

VIII.2. CALIBRATION

Calibration criteria were met. The initial calibration r^2 values, as appropriate, were $\geq$0.995 and all initial calibration verification recoveries were within 95-105% for anions and 90-110% for the remaining analyses, as appropriate. All continuing calibration verification recoveries were within 90-110% for all appropriate analyses. The MRL recoveries for ammonia, MBAS and hexavalent chromium were within the laboratory control limits of 50-150%. Analytical balance calibration logs were not provided for TDS and TSS analyses. Instrument calibration information for BOD was not provided.

For chronic toxicity, instruments were calibrated as per the manufacturer requirements and standard reference toxicant testing was performed to verify culture health and sensitivity. Method Test Acceptability criteria (TAC) were met.

VIII.3. QUALITY CONTROL SAMPLES

VIII.3.1. *METHOD BLANKS*

The method blanks and calibration blanks had no detects with the exception of ammonia in a bracketing CCB (-0.123 mg/L). The associated sample result was a detect <5× the absolute value of the negative blank concentration and was qualified as estimated with low potential bias (J-). Positive controls were within the laboratory and method established compliance criteria for chronic toxicity.

VIII.3.2. *LABORATORY CONTROL SAMPLES*

Laboratory control sample recoveries were within the laboratory control limits. Positive controls were within the laboratory and method established compliance criteria for chronic toxicity.

VIII.3.3. *LABORATORY DUPLICATES*

Laboratory duplicate analysis was performed on the sample in this SDG for Method 180.1. The RPD met the laboratory acceptance limit. Laboratory duplicate analyses were not performed on the sample in this SDG for the remaining methods.

VIII.3.4. *MATRIX SPIKE/MATRIX SPIKE DUPLICATE*

MS/MSD analyses were performed on the sample in this SDG for Methods 4500-CN-E and 5310B. Recoveries and RPDs met laboratory acceptance limits. MS/MSD analyses were not performed on the sample in this SDG for the remaining methods.

VIII.4. SAMPLE RESULT VERIFICATION

Calculations were verified, and the sample results reported on the sample results summary were verified against the raw data. No transcription errors or calculation errors were noted. It should be noted that raw data was not provided for Method 180.1; therefore, the sample result could not be verified. Results reported below the RL and above the MDL were qualified as estimated (J) and coded with a DNQ to comply with the NPDES permit reporting requirements. Reported nondetects are valid to the MDL.

VIII.5. FIELD QC SAMPLES

MEC^X evaluated field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^X used the remaining detects to evaluate the associated site sample. Findings associated with field QC samples are summarized below.

VIII.5.1. *FIELD BLANKS AND EQUIPMENT BLANKS*

Field blank or equipment blank samples were not identified for this SDG.

VIII.5.2. *FIELD DUPLICATES*

Field duplicate samples were not identified in this SDG.

Comments
This report is being revised to exclude 1-1-dimethylhyrazine and Hyrazine results.

Receipt
The samples were received on 1/8/2020 3:50 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 4 coolers at receipt time were 0.2º C, 0.5º C, 2.3º C and 3.1º C.

GC/MS VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

GC/MS Semi VOA
Method 625.1: The laboratory control sample and the laboratory control sample duplicate (LCS/LCSD) for preparation batch 440-589710 and analytical batch 440-590150 recovered outside below control limits for the following analyte: Hexachlorocyclopentadiene. This analyte has been identified as poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. The reported results may be biased low for these analytes.

Method 625.1: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 440-589710 and analytical batch 440-590150 were outside control limits. Sample matrix interference is suspected.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

HPLC/IC
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

GC Semi VOA
Method 608.3: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 440-589882 and analytical batch 440-589980. The laboratory control sample (LCS) was performed in duplicate to provide precision data for this batch: (LCS 440-589882/2-A)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method 200.8: The matrix spike / matrix spike duplicate (MS/MSD) recoveries and precision for preparation batch 440-589913 and analytical batch 440-590052 were outside control limits for Copper and Selenium. Sample matrix interference and/or non-homogeneity are suspected.

Method FILTRATION: The following sample requested dissolved metals and was not filtered in the field: Outfall018_20200108_Comp_F (440-258701-2). This sample was filtered and preserved upon receipt to the laboratory.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Subcontract non-Sister
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Methods 3510C, 608: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 440-589882. Method 8081-8082

Notes and Definitions

Item	Definition
% Rec	Percent Recovery
Dil	Dilution
dry	Sample results reported on a dry weight basis
MDA	Minimum Detectable Activity
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.

TIC	Tentatively Identified Compound (TIC) using mass spectrometry. The reported concentration is relative concentration based on the nearest internal standard. If the library search produces no matches at, or above 85%, the compound is reported as unknown.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

An Absence of Total Coliform meets the drinking water standards as established by the California State Water Resources Control Board (SWRCB)

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklists and the chains-of-custody (COCs) provided by the laboratories for sample delivery group (SDG) 440-258701-2:

- The laboratories received the sample in this SDG on ice and within the temperature limits of ≤6 degrees Celsius (°C) and >0°C.
- The laboratories received the sample containers intact and properly preserved, as applicable.
- Field and/or laboratory personnel signed and dated the original and transfer COCs.
- According to the Login Sample Receipt Checklist, custody seals were absent on the coolers upon receipt at TA-Irvine. No evidence of tampering was noted. The Login Sample Receipt Checklist indicated a custody seal was present (but with no number) upon receipt at TA-Sacramento.
- The case narrative indicated the site sample was received in wide-mouth amber glass bottles, and slightly less sample volume (914 milliliters) was available for extraction.

III. EPA METHOD 1613B — DIOXIN/FURANS

L. Calvin of MEC[X] reviewed the SDG on March 6, 2020.

The sample listed in Table 1 for this analysis was validated based on the guidelines outlined in the *MEC[X] Data Validation Procedure for Dioxins and Furans* (DVP-19, Rev. 0), *USEPA Method 1613B* and the *National Functional Guidelines Chlorinated Dioxin/Furan Data Review* (2011).

III.1. HOLDING TIMES

Extraction and analytical holding times were met. The water sample was extracted and analyzed within one year of collection.

III.2. INSTRUMENT PERFORMANCE

Instrument performance criteria were met. Following are findings associated with instrument performance:

III.2.1. *GC COLUMN PERFORMANCE*

A Windows Defining Mix (WDM) containing the first and last eluting congeners of each descriptor and isomer specificity compounds was analyzed prior to the initial calibration sequence and at the beginning of each analytical sequence. The GC column performance in the calibrations was acceptable, with the height of the valley between the closely eluting isomers and 2,3,7,8-TCDD reported as <25%.

III.2.2. *MASS SPECTROMETER PERFORMANCE*

The mass spectrometer performance was acceptable with the static resolving power >10,000.

III.3. CALIBRATION

Calibration criteria were met. The initial calibration was acceptable with %RSDs ≤20% for the 15 native compounds (calibration by isotope dilution) and ≤35% for the two native and all labeled compounds (calibration by internal standard). The relative retention times and ion abundance ratios were within the Method 1613B control limits for all standards.

Continuing Calibration: Calibration verification (VER) consisted of a mid-level standard (CS3) analyzed at the beginning of the analytical sequence. The VER was acceptable with the concentrations within the acceptance criteria listed in Table 6 of EPA Method 1613B. The ion abundance ratios and relative retention times were within the method control limits.

III.4. QUALITY CONTROL SAMPLES

III.4.1. *METHOD BLANKS*

The method blank had detects above the EDL and below the reporting limit (RL) for isomers 1,2,3,4,7,8-HxCDD, 1,2,3,7,8,9-HxCDF, 1,2,3,4,6,7,8-HpCDD, 1,2,3,4,6,7,8-HpCDF, OCDD and OCDF, and for totals HxCDD, HxCDF, HpCDD and HpCDF. The sample results for the isomer method blank contaminants detected below the RL were qualified as nondetects (U) at the level of contamination. The reviewer compared peaks comprising the method blank totals to those in the sample totals. The retention times of total HpCDD peaks in the sample matched those in the method blank, at similar concentrations; therefore, the result for total HpCDD was qualified as a nondetect (U) at the level of contamination. Sample totals HxCDD, HxCDF and

total HpCDF were qualified as estimated (J), as only a portion of the total was determined to be method blank contamination.

III.4.2. *LABORATORY CONTROL SAMPLES*

LCS recoveries were within the acceptance criteria listed in Table 6 of Method 1613B.

III.5. FIELD QC SAMPLES

MEC^X evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^X used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

III.5.1. *FIELD BLANKS AND EQUIPMENT BLANKS*

Field blank or equipment blank samples were not identified for this SDG.

III.5.2. *FIELD DUPLICATES*

Field duplicate samples were not identified in this SDG.

III.6. INTERNAL STANDARDS PERFORMANCE

The labeled standard recoveries were within the acceptance criteria listed in Table 7 of Method 1613B.

III.7. COMPOUND IDENTIFICATION

Compound identification was verified. With the exception of estimated maximum possible concentrations (EMPCs), detected compounds met the ion abundance ratio, retention time window and signal-to-noise ratio criteria for identification. The laboratory analyzed for polychlorinated dioxins/furans by EPA Method 1613B. Second-column confirmation analysis for isomer 2,3,7,8-TCDF was not performed, as 2,3,7,8-TCDF was not detected in the initial analysis of the sample.

III.8. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantitation was verified by recalculating a representative number of sample results. The laboratory calculated and reported compound-specific detection limits. Detects between the EDL and the RL were qualified as estimated (J) and coded with DNQ to comply with the NPDES permit. Nondetects are valid to the EDL. Per client request, results below the EDL meeting retention time and signal to noise (S/N) criteria were to be reported; however, this sample had no reported detects below the EDL.

As noted in the case narrative, RLs and EDLs were slightly elevated due to somewhat limited sample volume. Rather than approximately 1000 milliliters (ml), a 914 ml sample volume was available for extraction.

Isomers and total HpCDD previously qualified as method blank contamination were not further qualified as EMPCs. Isomers 1,2,3,7,8,9-HxCDD and 1,2,3,7,8-PeCDD reported as EMPCs were qualified as estimated nondetects (UJ) at the level of the EMPC. Total PeCDD consisted of the single isomer EMPC peak qualified in the sample and was therefore also qualified as an estimated nondetect (UJ). Totals HpCDF, HxCDD and HxCDF included one or more EMPC peaks and were therefore qualified as estimated (J).

Receipt
The samples were received on 1/8/2020 3:50 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 4 coolers at receipt time were 0.2º C, 0.5º C, 2.3º C and 3.1º C.

Dioxin
Method 1613B: EPA Method 1613B specifies a +/- 15 second retention time difference between the recovery standard in the initial calibration (ICAL) and the continuing calibration verification (CCV). The 13C-1,2,3,4-TCDD associated with the following samples run on instrument DFS 1 exceeded this criteria: Outfall018_20200108_Comp (440-258701-1), (CCV 320-352632/2), (LCS 320-351765/2-A) and (MB 320-351765/1-A). This retention time shift is due to normal and reasonable column maintenance and does not affect the instrument chromatography resolution, sensitivity, or identification of target analytes. System retention times have been updated for proper analyte identification.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Dioxin Prep

II. SAMPLE MANAGEMENT

According to the case narrative, sample condition upon receipt forms and the chains-of-custody (COCs) provided by the laboratories for sample delivery group (SDG) 440-258701-3:

- The laboratories received the sample in this SDG on ice and within the temperature limits of ≤6 degrees Celsius (°C) and >0°C.
- The laboratories received the sample containers intact.
- Field and laboratory personnel signed and dated the COCs.
- Some corrections to the original COCs were not dated. The cross-outs did not affect data quality.
- Sample containers were transferred to TestAmerica – St. Louis laboratory for all radionuclide analyses.

III. VARIOUS EPA METHODS —RADIONUCLIDES

E. Wessling of MEC[X] reviewed the SDG on March 6, 2020

The sample listed in Table 1 for these analyses was validated based on the guidelines outlined in the *EPA Methods 900, 901.1, 903.0, 904.0, 905.0, 906.0 and HASL-300 U Mod* and the *National Functional Guidelines for Superfund Inorganic Method Data Review* (2017).

III.1. HOLDING TIMES:

According to the case narrative, the sample was received properly preserved.

III.2. CALIBRATION:

The detector efficiencies for gross alpha and radium-226 were less than 20%; therefore, the detected result for gross alpha and radium-226 were qualified as estimated nondetects (UJ). All other detector efficiencies were greater than 20% and no further qualifications were required. Carrier/tracer recoveries were within the laboratory control limits. Calibration checks were verified as acceptable for all methods with the exception of cross-talk for gross beta and strontium-90. These daily checks were noted as DOEF and as a conservative measure these isotopes were qualified as estimated, (J for detects and UJ for nondetects).

III.3. QUALITY CONTROL SAMPLES

III.3.1. *METHOD BLANKS*

Target isotopes were not detected in the method blanks above the MDC. However, a comparison normalized absolute difference of the sample results and the method blank results indicated the method blank and the sample results were not significantly different at the 5% level of confidence for gross beta. The detected sample result for gross beta was qualified as estimated (J+).

III.3.2. *LABORATORY CONTROL SAMPLES:*

The recoveries were within laboratory-established control limits.

III.3.3. *LABORATORY DUPLICATES:*

Laboratory duplicates were performed on the sample from this SDG for cesium-137 and potassium-40. DERs were <1.

III.3.4. *MATRIX SPIKE/MATRIX SPIKE DUPLICATE:*

Matrix spike (MS)/MSD analyses were not performed on the sample from this SDG.

III.4. SAMPLE RESULT VERIFICATION:

An EPA Level IV review was performed on the sample in this data package. Calculations were verified from the raw data and were determined to be accurate within a reasonable margin of error attributable to differences in significant figures. Reported nondetects are valid to the MDC.

III.5. FIELD QC SAMPLES:

Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site samples. The following are findings associated with field QC samples:

III.5.1. *FIELD BLANKS AND EQUIPMENT BLANKS:*

This SDG had no identified field blank or equipment blank samples.

III.5.2. *FIELD DUPLICATES:*

There were no field duplicate samples identified for this SDG.

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Many isotopes requested for analysis do not have any gamma emissions, or the gamma emissions they do have are very poor. Often, such analytes are reported by gamma spectrometry assuming secular equilibrium with a longer-lived parent. The client should ensure that such inference is acceptable for their sample based upon process knowledge. The following assumptions were made for this report:

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklist, and the chain-of-custody (COC) provided by the laboratory for sample delivery group (SDG) 440-262966-1:

- The laboratory received the sample in this SDG on ice and within the temperature limits of ≤6 degrees Celsius (°C) and >0°C.
- The laboratory received the sample containers intact and properly preserved, as applicable.
- Field and laboratory personnel signed and dated the COC.
- According to the Login Sample Receipt Checklist, custody seals were absent on the coolers upon receipt at TA-Irvine; however, no evidence of tampering was noted.
- The case narrative indicated that two of three vials for the VOC analysis of the trip blank were received with headspace. A third vial without headspace remained for analysis. No qualification was necessary.

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklists and the chains-of-custody (COCs) provided by the laboratories for sample delivery group (SDG) 440-263076-1:

- The laboratories received the sample in this SDG on ice and within the temperature limits of ≤6 degrees Celsius (°C) and >0°C.
- The laboratories received the sample containers intact and properly preserved, as applicable.
- Field and/or laboratory personnel signed and dated the original and transfer COCs.
- According to the Login Sample Receipt Checklist, custody seals were absent on the coolers upon receipt at TA-Irvine. No evidence of tampering was noted. The Login Sample Receipt Checklist indicated a custody seal was present (but with no number) upon receipt at TA-Sacramento.
- The case narrative indicated the site sample was received in wide-mouth amber glass bottles, and slightly less sample volume (966 milliliters) was available for extraction.

III. EPA METHOD 1613B — DIOXIN/FURANS

E. Wessling of MEC[X] reviewed the SDG on April 16, 2020.

The sample listed in Table 1 for this analysis was validated based on the guidelines outlined in the *MEC[X] Data Validation Procedure for Dioxins and Furans* (DVP-19, Rev. 0), *USEPA Method 1613B* and the *National Functional Guidelines Chlorinated Dioxin/Furan Data Review* (2011).

III.1. HOLDING TIMES

Extraction and analytical holding times were met. The water sample was extracted and analyzed within one year of collection.

III.2. INSTRUMENT PERFORMANCE

Instrument performance criteria were not evaluated during a Stage II validation.

III.3. CALIBRATION

Calibration criteria were not evaluated during a Stage II validation.

III.4. QUALITY CONTROL SAMPLES

III.4.1. *METHOD BLANKS*

The method blank had detects above the EDL and below the reporting limit (RL) for isomers 1,2,3,4,6,7,8-HpCDD, 1,2,3,4,7,8-HxCDD, 1,2,3,7,8,9-HxCDF, OCDD and OCDF, and for totals HxCDD, HxCDF and HpCDD. The sample results for the isomer method blank contaminants detected below the RL were qualified as nondetects (U) at the level of contamination. The concentrations in the method blank for OCDD and OCDF were insufficient to qualify the site sample. The reviewer compared concentrations comprising the isomer to those in the sample totals. Sample totals were qualified as estimated (J), as only a portion of the total was determined to be method blank contamination.

III.4.2. *LABORATORY CONTROL SAMPLES*

LCS recoveries were within the acceptance criteria listed in Table 6 of Method 1613B.

III.5. FIELD QC SAMPLES

MEC[X] evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC[X] used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

III.5.1. *FIELD BLANKS AND EQUIPMENT BLANKS*

Field blank or equipment blank samples were not identified for this SDG.

III.5.2. *FIELD DUPLICATES*

Field duplicate samples were not identified in this SDG.

III.6. INTERNAL STANDARDS PERFORMANCE

The labeled standard recoveries were not evaluated during a Stage II validation.

III.7. COMPOUND IDENTIFICATION

Compound identification was not evaluated during a Stage II validation. With the exception of estimated maximum possible concentrations (EMPCs), detected compounds met the ion abundance ratio, retention time window and signal-to-noise ratio criteria for identification. The laboratory analyzed for polychlorinated dioxins/furans by EPA Method 1613B. Second-column confirmation analysis for isomer 2,3,7,8-TCDF was performed. The nondetect for 2,3,7,8-TCDF from the more selective confirmation column was accepted as the preferred value and the original value rejected.

III.8. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantitation was not evaluated during a Stage II validation. The laboratory calculated and reported compound-specific detection limits. Detects between the EDL and the RL were qualified as estimated (J) and coded with DNQ to comply with the NPDES permit. Nondetects are valid to the EDL. Per client request, results below the EDL meeting retention time and signal to noise (S/N) criteria were to be reported; however, this sample had no reported detects below the EDL.

As noted in the case narrative, RLs and EDLs were slightly elevated due to somewhat limited sample volume. Rather than approximately 1000 milliliters (ml), a 966 ml sample volume was available for extraction.

Isomers previously qualified as method blank contamination were not further qualified as EMPCs. Isomers 1,2,3,4,7,8,9-HpCDF, 1,2,3,6,7,8-HxCDD, 2,3,4,6,7,8-HxCDF and 1,2,3,7,8-PeCDF reported as EMPCs were qualified as estimated nondetects (UJ) at the level of the EMPC. The totals included one or more EMPC peaks and were therefore qualified as estimated (J).

Receipt
The samples were received on 3/14/2020 5:30 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 3 coolers at receipt time were 1.3º C, 2.1º C and 4.4º C.

GC/MS Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

HPLC/IC
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

GC Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Dioxin
Method 1613B: EPA Method 1613B specifies a +/- 15 second retention time difference between the recovery standard in the initial calibration (ICAL) and the continuing calibration verification (CCV). The 13C-1,2,3,4-TCDD associated with the following samples run on instrument DFS 1 exceeded this criteria: Outfall018_20200314_Comp (440-263076-1), (CCV 320-366401/17), (LCS 320-365527/2-A) and (MB 320-365527/1-A). This retention time shift is due to normal and reasonable column maintenance and does not affect the instrument chromatography resolution, sensitivity, or identification of target analytes. System retention times have been updated for proper analyte identification.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method FILTRATION: The following samples requested dissolved metals and were not filtered in the field: Outfall018_20200314_Comp (440-263076-1) and Outfall018_20200314_Comp_F (440-263076-3). These samples were filtered and preserved upon receipt to the laboratory.

2.5mL of HNO3
HNO3 Lot # 0000234822

Method 200.7 Rev 4.4: The continuing calibration blank (CCB) for analytical batch 440-601371 contained Magnesium above the reporting limit (RL). All reported samples associated with this CCB were either ND for this analyte or contained this analyte at a concentration greater than 10X the value found in the CCB; therefore, re-analysis of samples was not performed.

Method 200.7 Rev 4.4: The method blank for preparation batch 440-600817 and 440-600971 and analytical batch 440-601371 contained Iron above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method 200.7 Rev 4.4: The initial calibration verification (ICV) result for batch 440-601371 was above the upper control limit for Zinc. Sample results were non-detects, and have been reported as qualified data.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Receipt
The samples were received on 3/14/2020 5:30 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 3 coolers at receipt time were 1.3º C, 2.1º C and 4.4º C.

RAD
Method 900.0: Gross Alpha/Beta Prep Batch 160-465288

The gross alpha detection goal was not met for the following samples due to a reduction of the sample size attributed to high residual mass. Analytical results are reported with the MDC achieved.
Outfall018_20200314_Comp (440-263076-1), (440-263045-Q-1-E) and (440-263045-Q-1-J DU).

Method 900.0: Gross Alpha/Beta Prep Batch 160-465288
Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Outfall018_20200314_Comp (440-263076-1), (LCS 160-465288/2-A), (LCSB 160-465288/3-A), (MB 160-465288/1-A), (440-263045-Q-1-E), (440-263045-Q-1-J DU), (440-263045-Q-1-F MS), (440-263045-Q-1-H MSBT), (440-263045-Q-1-I MSBTD) and (440-263045-Q-1-G MSD)

Method 901.1: Gamma Prep Batch 160-464923
Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Many isotopes requested for analysis do not have any gamma emissions, or the gamma emissions they do have are very poor. Often, such analytes are reported by gamma spectrometry assuming secular equilibrium with a longer-lived parent. The client should ensure that such inference is acceptable for their sample based upon process knowledge. The following assumptions were made for this report:

Method 906.0: LSC Tritium Prep Batch 160-466637

In an initial count, the subtraction background (BKG) was elevated, and several samples exhibited high negative results. The samples were re-aliquotted from the remaining distillate and recounted, exhibiting a normal BKG value. The MS and MSD were inadvertently “post spiked” during the realiquot, resulting in a spike value of 1100% of the normal amount (the original spike is distributed over the 100 mL aliquot, whereas the post spike only in the 10 mL portion measured). The MS and MSD recoveries are in limits in the re-aliquot, and they were within limits in the prior count. The laboratory does not believe this adversely affects the data.

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklists and the chains-of-custody (COCs) provided by the laboratories for sample delivery group (SDG) 440-263671-1:

- The laboratories received the sample in this SDG on ice and within the temperature limits of ≤6 degrees Celsius (°C) and >0°C.
- The laboratories received the sample containers intact and properly preserved, as applicable.
- Field and/or laboratory personnel signed and dated the original and transfer COCs.
- According to the Login Sample Receipt Checklist, custody seals were absent on the coolers upon receipt at TA-Irvine. No evidence of tampering was noted. The Login Sample Receipt Checklist indicated a custody seal was present (but with no number) upon receipt at TA-Sacramento.
- The case narrative indicated the site sample was received in wide-mouth amber glass bottles, and slightly less sample volume (954 milliliters) was available for extraction.

III. EPA METHOD 1613B — DIOXIN/FURANS

E. Wessling of MEC[X] reviewed the SDG on April 16, 2020.

The sample listed in Table 1 for this analysis was validated based on the guidelines outlined in the *MEC[X] Data Validation Procedure for Dioxins and Furans* (DVP-19, Rev. 0), *USEPA Method 1613B* and the *National Functional Guidelines Chlorinated Dioxin/Furan Data Review* (2011).

III.1. HOLDING TIMES

Extraction and analytical holding times were met. The water sample was extracted and analyzed within one year of collection.

III.2. INSTRUMENT PERFORMANCE

Instrument performance criteria were not evaluated during a Stage II validation.

III.3. CALIBRATION

Calibration criteria were not evaluated during a Stage II validation.

III.4. QUALITY CONTROL SAMPLES

III.4.1. *METHOD BLANKS*

The method blank had detects above the EDL and below the reporting limit (RL) for all isomers except 2,3,7,8-TCDD, 2,3,7,8-TCDF, 1,2,3,4,7,8-HxCDF and 1,2,3,6,7,8-HxCDF, and for all totals except TCDD and TCDF. The sample results for the isomer method blank contaminants detected below the RL were qualified as nondetects (U) at the level of contamination. The reviewer compared concentrations comprising the isomer to those in the sample totals. Total HxCDD and PeCDD were comprised of peaks qualified as nondetects due to blank contamination and were therefore qualified as nondetects (U). The remaining sample totals were qualified as estimated (J), as only a portion of the total was determined to be method blank contamination.

III.4.2. *LABORATORY CONTROL SAMPLES*

LCS recoveries were within the acceptance criteria listed in Table 6 of Method 1613B.

III.5. FIELD QC SAMPLES

MEC[X] evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC[X] used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

III.5.1. *FIELD BLANKS AND EQUIPMENT BLANKS*

Field blank or equipment blank samples were not identified for this SDG.

III.5.2. *FIELD DUPLICATES*

Field duplicate samples were not identified in this SDG.

III.6. INTERNAL STANDARDS PERFORMANCE

The labeled standard recoveries were not evaluated during a Stage II validation.

III.7. COMPOUND IDENTIFICATION

Compound identification was not evaluated during a Stage II validation. With the exception of estimated maximum possible concentrations (EMPCs), detected compounds met the ion abundance ratio, retention time window and signal-to-noise ratio criteria for identification. The laboratory analyzed for polychlorinated dioxins/furans by EPA Method 1613B. Second-column confirmation analysis for isomer 2,3,7,8-TCDF was not required, as 2,3,7,8-TCDF was not detected in the initial analysis of the sample.

III.8. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantitation was not evaluated during a Stage II validation. The laboratory calculated and reported compound-specific detection limits. Detects between the EDL and the RL were qualified as estimated (J) and coded with DNQ to comply with the NPDES permit. Nondetects are valid to the EDL. Per client request, results below the EDL meeting retention time and signal to noise (S/N) criteria were to be reported; however, this sample had no reported detects below the EDL.

As noted in the case narrative, RLs and EDLs were slightly elevated due to somewhat limited sample volume. Rather than approximately 1000 milliliters (ml), a 954 ml sample volume was available for extraction.

Isomers, total PeCDD and total HxCDD previously qualified as method blank contamination were not further qualified as EMPCs. Isomers 2,3,7,8-TCDD, 1,2,3,4,7,8-HxCDD and 1,2,3,6,7,8-HxCDD reported as EMPCs were qualified as estimated nondetects (UJ) at the level of the EMPC. Total TCDD consisted of the single isomer EMPC peak qualified in the sample and was therefore also qualified as an estimated nondetect (UJ). Total HxCDF consisted of a blank contaminant and an EMPC and was therefore qualified as an estimated nondetect (UJ). The remaining totals included one or more EMPC peaks and were therefore qualified as estimated (J).

Receipt
The samples were received on 3/26/2020 5:17 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 3 coolers at receipt time were 0.8º C, 1.3º C and 2.8º C.

GC/MS Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

HPLC/IC
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

GC Semi VOA
Method 608.3: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 440-602622 and analytical batch 440-602694. The laboratory control sample (LCS) was performed in duplicate to provide precision data for this batch: (LCS 440-602622/2-A)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Dioxin
Method 1613B: EPA Method 1613B specifies a +/- 15 second retention time difference between the recovery standard in the initial calibration (ICAL) and the continuing calibration verification (CCV). The 13C-1,2,3,4-TCDD and 13C-1,2,3,7,8,9-HxCDD associated with the following samples run on instrument 10D5 exceeded this criteria: Outfall018_20200326_Comp (440-263671-1), (CCV 320-369099/2), (LCS 320-368628/2-A) and (MB 320-368628/1-A). This retention time shift is due to normal and reasonable column maintenance and does not affect the instrument chromatography resolution, sensitivity, or identification of target analytes. System retention times have been updated for proper analyte identification.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method FILTRATION: The following sample requested dissolved metals and was not filtered in the field: Outfall018_20200326_Comp_F (440-263671-3). This sample was filtered and preserved upon receipt to the laboratory.

03/27/20
2.5mL of HNO3
HNO3 Lot # 0000234822

Method 200.7 Rev 4.4: The continuing calibration blank (CCB) for 440-602844 contained Magnesium above the reporting limit (RL). All reported samples associated with this CCB were either ND for this analyte or contained this analyte at a concentration greater than 10X the value found in the CCB; therefore, re-analysis of samples was not performed.

Method 200.7 Rev 4.4: The method blank for preparation batch 440-602732 and 440-602745 and analytical batch 440-602973 contained Magnesium above the reporting limit (RL). Associated sample(s) were not re-extracted and/or re-analyzed because results were greater than 10X the value found in the method blank.

Method 200.7 Rev 4.4: The matrix spike / matrix spike duplicate (MS/MSD) recoveries of Aluminum and Arsenic for preparation batch 440-602732 and 440-602745 and analytical batch 440-602973 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected. The associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Method 900.0: Gross Alpha-Beta Prep Batch 160-466162
Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Many isotopes requested for analysis do not have any gamma emissions, or the gamma emissions they do have are very poor. Often, such analytes are reported by gamma spectrometry assuming secular equilibrium with a longer-lived parent. The client should ensure that such inference is acceptable for their sample based upon process knowledge. The following assumptions were made for this report:

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklists and the chains-of-custody (COCs) provided by the laboratories for sample delivery group (SDG) 440-262953-1:

- The laboratories received the sample in this SDG on ice and within the temperature limits of ≤6 degrees Celsius (°C) and >0°C.
- The laboratories received the sample containers intact and properly preserved, as applicable.
- Field and/or laboratory personnel signed and dated the original and transfer COCs.
- According to the Login Sample Receipt Checklist, custody seals were absent on the coolers upon receipt at TA-Irvine. No evidence of tampering was noted. The Login Sample Receipt Checklist indicated a custody seal was present (but with no number) upon receipt at TA-Sacramento. The client sample ID on the transfer COC was incorrect but was corrected for reporting purposes. (The client sample ID included the initials of the sampler where part of the sample ID was crossed out.)
- The case narrative indicated the site sample was received in wide-mouth amber glass bottles, and slightly less sample volume (956.2 milliliters) was available for extraction.

III. EPA METHOD 1613B — DIOXIN/FURANS

E. Wessling of MEC[X] reviewed the SDG on April 16, 2020.

The sample listed in Table 1 for this analysis was validated based on the guidelines outlined in the *MEC[X] Data Validation Procedure for Dioxins and Furans* (DVP-19, Rev. 0), *USEPA Method 1613B* and the *National Functional Guidelines Chlorinated Dioxin/Furan Data Review* (2011).

III.1. HOLDING TIMES

Extraction and analytical holding times were met. The water sample was extracted and analyzed within one year of collection.

III.2. INSTRUMENT PERFORMANCE

Instrument performance criteria were not evaluated during a Stage II validation.

III.3. CALIBRATION

Calibration criteria were not evaluated during a Stage II validation.

III.4. QUALITY CONTROL SAMPLES

III.4.1. *METHOD BLANKS*

The method blank had detects above the EDL and below the reporting limit (RL) for isomers 1,2,3,4,6,7,8-HpCDD, 1,2,3,4,7,8-HxCDD, 1,2,3,7,8,9-HxCDF, OCDD and OCDF, and for totals HxCDD, HxCDF and HpCDD. The sample results for the isomer method blank contaminants detected below the RL were qualified as nondetects (U) at the level of contamination. The method blank results were insufficient to qualify the detects for OCDD, OCDF and 1,2,3,4,6,7,8-HpCDD. The reviewer compared concentrations comprising the isomer to those in the sample totals. Sample totals were qualified as estimated (J), as only a portion of the total was determined to be method blank contamination.

III.4.2. *LABORATORY CONTROL SAMPLES*

LCS recoveries were within the acceptance criteria listed in Table 6 of Method 1613B.

III.5. FIELD QC SAMPLES

MEC[X] evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC[X] used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

III.5.1. *FIELD BLANKS AND EQUIPMENT BLANKS*

Field blank or equipment blank samples were not identified for this SDG.

III.5.2. *FIELD DUPLICATES*

Field duplicate samples were not identified in this SDG.

III.6. INTERNAL STANDARDS PERFORMANCE

The labeled standard recoveries were not evaluated during a Stage II validation.

III.7. COMPOUND IDENTIFICATION

Compound identification was not evaluated during a Stage II validation. With the exception of estimated maximum possible concentrations (EMPCs), detected compounds met the ion abundance ratio, retention time window and signal-to-noise ratio criteria for identification. The laboratory analyzed for polychlorinated dioxins/furans by EPA Method 1613B. Second-column confirmation analysis for isomer 2,3,7,8-TCDF was not required, as 2,3,7,8-TCDF was not detected in the initial analysis of the sample.

III.8. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantitation was not evaluated during a Stage II validation. The laboratory calculated and reported compound-specific detection limits. Detects between the EDL and the RL were qualified as estimated (J) and coded with DNQ to comply with the NPDES permit. Nondetects are valid to the EDL. Per client request, results below the EDL meeting retention time and signal to noise (S/N) criteria were to be reported; however, this sample had no reported detects below the EDL.

As noted in the case narrative, RLs and EDLs were slightly elevated due to somewhat limited sample volume. Rather than approximately 1000 milliliters (ml), a 956 ml sample volume was available for extraction.

Isomers previously qualified as method blank contamination were not further qualified as EMPCs. Isomers 1,2,3,4,7,8,9-HpCDF and 1,2,3,4,7,8-HxCDF reported as EMPCs were qualified as estimated nondetects (UJ) at the level of the EMPC. The totals for HpCDF, HxCDD and HxCDF included one or more EMPC peaks and were therefore qualified as estimated (J).

Notes and Definitions

Item	Definition
MS-05	The spike recovery and/or RPD were outside acceptance limits for the MS and/or MSD due to possible matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
S-GC	Surrogate recovery outside of control limits due to a possible matrix effect . The data was accepted based on valid recovery of the remaining surrogate.
% Rec	Percent Recovery
Dil	Dilution
dry	Sample results reported on a dry weight basis
MDA	Minimum Detectable Activity
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
NR	Not Reportable
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.
TIC	Tentatively Identified Compound (TIC) using mass spectrometry. The reported concentration is relative concentration based on the nearest internal standard. If the library search produces no matches at, or above 85%, the compound is reported as unknown.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

An Absence of Total Coliform meets the drinking water standards as established by the California State Water Resources Control Board (SWRCB)

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mL**	milliliter(s)
C	degrees Celsius	**MPN**	Most Probable Number
cfu	colony forming units	**N.D.**	non-detect
CP Units	cobalt-chloroplatinate units	**ng**	nanogram(s)
F	degrees Fahrenheit	**NTU**	nephelometric turbidity units
g	gram(s)	**pg/L**	picogram/liter
IU	International Units	**RL**	Reporting Limit
kg	kilogram(s)	**TNTC**	Too Numerous To Count
L	liter(s)	**µg**	microgram(s)
lb.	pound(s)	**µL**	microliter(s)
m3	cubic meter(s)	**umhos/cm**	micromhos/cm
meq	milliequivalents	**MCL**	Maximum Contamination Limit
mg	milligram(s)		

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

Data Qualifiers

Qualifier	Definition
C	Result confirmed by reanalysis
D1	Indicates for dual column analyses that the result is reported from column 1
D2	Indicates for dual column analyses that the result is reported from column 2
E	Concentration exceeds the calibration range
K1	Initial Calibration Blank is above the QC limit and the sample result is ND
K2	Continuing Calibration Blank is above the QC limit and the sample result is ND
K3	Initial Calibration Verification is above the QC limit and the sample result is ND
K4	Continuing Calibration Verification is above the QC limit and the sample result is ND
J (or G, I, X)	Estimated value >= the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P	Concentration difference between the primary and confirmation column >40%. The lower result is reported.
P^	Concentration difference between the primary and confirmation column > 40%. The higher result is reported.
U	Analyte was not detected at the value indicated
V	Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference.
W	The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Report Generated: March 31, 2020

Non-Detect Results

In sample(s) classified as non-detect, the host-associated fecal gene biomarker(s) was either not detected in test replicates, one replicate was detected at a cycle threshold greater than 35 and the other was not, or one replicate was detected at a cycle threshold less than 35 and the other was not after repeated analysis.

Detected Results

In sample(s) classified as detected, the host-associated fecal gene biomarker(s) was detected in both test replicates suggesting that the host's fecal contamination is present in the sample(s). Copy number measurements reported are relative, not absolute, quantification.

Detected Not Quantified (DNQ) Results

In sample(s) classified as Detected Not Quantified (DNQ), the host-associated fecal biomarker was detected in both test replicates but in quantities below the limit of quantification. This result indicates that fecal indicators associated with the respective host was present in the sample(s) but in low concentrations.

Fecal Reference Samples

The client is encouraged to submit fecal samples from suspected sources in the surrounding area in order to gain a better understanding of the concentration of the host-associated biomarker with the regional population. A more precise interpretation would be available to the client with the submittal of such baseline samples.

Result Interpretations

The presence of the biomarker does not signify the presence or absence of that form of fecal pollution conclusively. The most reliable way to accurately test for contamination is to combine genetic testing with scientifically sound and adequate study design appropriate for the water quality questions to be answered or issues to be resolved.

Additional Testing

A portion of all samples has been frozen and will be archived for 3 months. The client is encouraged to perform additional tests on the sample(s) for other hosts suspected of contributing to the fecal contamination.

Limitation of Damages – Repayment of Service Price

It is agreed that in the event of breach of any warranty or breach of contract, or negligence of Source Molecular Corporation, as well as its agents or representatives, the liability of the company shall be limited to the repayment, to the purchaser (submitter), of the individual analysis price paid by him/her to Source Molecular Corp. The company shall not be liable for any damages, either direct or consequential. Source Molecular Corp. provides analytical services on a PRIME CONTRACT BASIS ONLY. Terms are available upon request. The sample(s) cited in this report may be used for research purposes after an archiving period of 3 months from the date of this report. Research includes, but is not limited to internal validation studies and peer-reviewed research publications. Anonymity of the sample(s), including the exact geographic location will be maintained by assigning an arbitrary internal reference. These anonymous samples will only be grouped by state / province of origin for research purposes. The client must contact Source Molecular in writing within 10 days from the date of this report if he/she does not wish for their submitted sample(s) to be used for any type of future research.

DNA Analytical Method Explanation

Water Samples: Each submitted water sample is filtered through 0.45 micron membrane filter(s). Each filter is placed in a separate, sterile 2ml disposable tube containing a unique mix of beads and lysis buffer. The sample is homogenized for 1min and the DNA extracted using the Generite DNA-EZ ST1 extraction kit (GeneRite, NJ), as per manufacturer's protocol. Devitations to these procedures may occur at the client's request.

Non-Water Samples: Each non-water sample submitted by the client is processed as per internal laboratory extraction procedures. An extracted DNA sample is proceed directly to PCR analysis. Details available upon request.

Amplifications to detect the target gene biomarker were run on an Applied Biosystems StepOnePlus real-time thermal cycler (Applied Biosystems, Foster City, CA) in a final reaction volume of 20ul sample extract, forward primer, reverse primer, probe and an optimized buffer. All assays are run in duplicate. Quantification is achieved by extrapolating target gene copy numbers from a standard curve generated from serial dilutions of known gene copy numbers.

For quality control purposes, a positive control and a negative control, were run alongside the sample(s) to ensure a properly functioning reaction and reveal any false negatives or false positives.

Laboratory Comments

Non-Detect Results

In sample(s) classified as non-detect, the host-associated fecal gene biomarker(s) was either not detected in test replicates, one replicate was detected at a cycle threshold greater than 35 and the other was not, or one replicate was detected at a cycle threshold less than 35 and the other was not after repeated analysis.

Detected Results

In sample(s) classified as detected, the host-associated fecal gene biomarker(s) was detected in both test replicates suggesting that the host's fecal contamination is present in the sample(s). Copy number measurements reported are relative, not absolute, quantification.

Detected Not Quantified (DNQ) Results

In sample(s) classified as Detected Not Quantified (DNQ), the host-associated fecal biomarker was detected in both test replicates but in quantities below the limit of quantification. This result indicates that fecal indicators associated with the respective host was present in the sample(s) but in low concentrations.

Fecal Reference Samples

The client is encouraged to submit fecal samples from suspected sources in the surrounding area in order to gain a better understanding of the concentration of the host-associated biomarker with the regional population. A more precise interpretation would be available to the client with the submittal of such baseline samples.

Result Interpretations

The presence of the biomarker does not signify the presence or absence of that form of fecal pollution conclusively. The most reliable way to accurately test for contamination is to combine genetic testing with scientifically sound and adequate study design appropriate for the water quality questions to be answered or issues to be resolved.

Additional Testing

A portion of all samples has been frozen and will be archived for 3 months. The client is encouraged to perform additional tests on the sample(s) for other hosts suspected of contributing to the fecal contamination.

Limitation of Damages – Repayment of Service Price

It is agreed that in the event of breach of any warranty or breach of contract, or negligence of Source Molecular Corporation, as well as its agents or representatives, the liability of the company shall be limited to the repayment, to the purchaser (submitter), of the individual analysis price paid by him/her to Source Molecular Corp. The company shall not be liable for any damages, either direct or consequential. Source Molecular Corp. provides analytical services on a PRIME CONTRACT BASIS ONLY. Terms are available upon request. The sample(s) cited in this report may be used for research purposes after an archiving period of 3 months from the date of this report. Research includes, but is not limited to internal validation studies and peer-reviewed research publications. Anonymity of the sample(s), including the exact geographic location will be maintained by assigning an arbitrary internal reference. These anonymous samples will only be grouped by state / province of origin for research purposes. The client must contact Source Molecular in writing within 10 days from the date of this report if he/she does not wish for their submitted sample(s) to be used for any type of future research.

DNA Analytical Method Explanation

Water Samples: Each submitted water sample is filtered through 0.45 micron membrane filter(s). Each filter is placed in a separate, sterile 2ml disposable tube containing a unique mix of beads and lysis buffer. The sample is homogenized for 1min and the DNA extracted using the Generite DNA-EZ ST1 extraction kit (GeneRite, NJ), as per manufacturer's protocol. Devitations to these procedures may occur at the client's request.

Non-Water Samples: Each non-water sample submitted by the client is processed as per internal laboratory extraction procedures. An extracted DNA sample is proceed directly to PCR analysis. Details available upon request.

Amplifications to detect the target gene biomarker were run on an Applied Biosystems StepOnePlus real-time thermal cycler (Applied Biosystems, Foster City, CA) in a final reaction volume of 20ul sample extract, forward primer, reverse primer, probe and an optimized buffer. All assays are run in duplicate. Quantification is achieved by extrapolating target gene copy numbers from a standard curve generated from serial dilutions of known gene copy numbers.

For quality control purposes, a positive control and a negative control, were run alongside the sample(s) to ensure a properly functioning reaction and reveal any false negatives or false positives.

REASONABLE POTENTIAL ANALYSIS SUMMARY NOTES
THE BOEING COMPANY
SANTA SUSANA FIELD LABORATORY
NPDES PERMIT CA0001309

Notes:

1. The following Reasonable Potential Analysis (RPA) provides the analytical results as performed by the procedures outlined in *Reasonable Potential Analysis Methodology Technical Memo* (MWH and Flow Science, 2006).

2. The monitoring data set utilized to conduct the RPA consists of all applicable and relevant data from the present reporting quarter.

3. As directed by the CTR and the Regional Water Control Board 2,3,7,8-TCDD (Dioxin) values are to be expressed in NPDES permitting and this RPA as TCDD Total Equivalence units (TEQs). A TCDD TEQ is determined by multiplying each of the seventeen dioxin and furan congeners by their respective toxicity equivalency factor (TEF) and bioaccumulation equivalency factor (BEF) then summing the results of those products. For the purposes of this RPA, the resulting TCDD TEQ does not include those congener concentrations that are reported as DNQ, as specified on Page 26, of the NPDES Permit Effective April 1, 2015 (Water Board, 2015).

4. Data reported with qualifiers (e.g., J [DNQ] or R) are considered estimated or rejected and are not used in this RPA.

5. All of the following abbreviations and/or notes may not occur on every table.

6. Based on ORDER NO. R4-2015-0033, page E-2, Section I.C, only pollutants which do not have a final effluent limitation in the NPDES permit are included in this RPA analysis.

Priority Pollutant RPA Column Explanation (Continued)

Basin Plan Criteria	Applicable Basin Plan Criteria are listed for the Los Angeles River and/or Calleguas Creek watersheds.
C = Lowest Criteria	The comparison concentration (C) is equal to the lowest criterion for a constituent based on the CMC, CCC, HH O, and Basin Plan Criteria listed.
Step 2 defines the applicable data set.	
Is Effluent Data Available	If all data is qualified, then NO. If not, then YES.
Step 3 determines the maximum observed effluent concentration.	
Was Constituent Detected in Effluent Data	If the constituent was detected, then YES. If all monitoring data are non-detect or qualified then NO. If constituent was not required as per NPDES Permit, then NA.
Are all Detection Limits >C	If constituent was detected in effluent data or if no lowest criteria exists, then not applicable (NA). If constituent was not detected and all analysis detection limits are greater than the comparison concentration, then YES, if not then NO.
If DL > C, MEC = Min (DL)	If the previous cell answer was yes, then the MEC is equal to the minimum detection limit. If not, then NA.
Step 4 compares the MEC to the lowest applicable water quality criteria.	
MEC >= C	If the MEC is greater than or equal to the comparison concentration then YES, if not then NO. If no comparison concentration exists, then NA.

Note: Steps 5 and 6 of the Priority Pollutant RPA do not apply to the Santa Susana Site because the Regional Board gives no consideration for receiving water background constituent concentrations. Furthermore, Boeing defers the application of best professional judgment in Step 7 and final determination of reasonable potential in Step 8 to the Regional Board Staff.

Non-priority Pollutant RPA Column Explanation

Constituent	Provides the Non-Priority Pollutant constituent common name
Monitoring	Provides the 2015 NPDES Permit directed monitoring frequency
Units	Provides the data set's concentration units
Number of Samples	Provides the number of available samples that are not qualified
MEC	Provides the outfall monitoring group's maximum value from the applicable data set
CV	Equal to the standard deviation divided by the average of the applicable data set. If the number of samples is less than 10, the CV is assumed to be 0.6.
Multiplier	Utilizes the EPA's TSD calculation to determine multiplier for which the maximum effluent concentration is calculated. (MWH and Flow Science, 2006, or EPA TSD, 1991)
Projected Maximum Effluent Concentration	Utilizes the product of the multiplier and the MEC as an estimate for the projected maximum effluent concentration.
99/99	Statistical technique used in the Environmental Protection Agency's Technical Support Document RPA to compute the upper 99th confidence range of the 99th % value of the log normal distribution of monitoring data.
Dilution Ratio	The Regional Board allocates no dilution ratio to the Santa Susana Site (NA).
Background Concentration	The Regional Board allocates no background concentration to the Santa Susana Site (NA).

THE BOEING COMPANY
SANTA SUSANA FIELD LABORATORY
NPDES PERMIT CA0001309

Projected Maximum Receiving Water Concentration	The Regional Board estimates the projected maximum receiving water concentration as equal to the projected maximum effluent concentration.

Non-priority Pollutant RPA Column Explanation (Continued)

Step 1, Determine Water Quality Objectives	The water quality objective is based on appropriate Basin Plan criteria as noted in the Reasonable Potential Analysis Methodology Technical Memo.
BU – Beneficial Use Protection, NC – Human Non-carcinogen, AP- Aquatic Life Protection, TMDL – Total Maximum Daily Load	This is the Regional Board's Basis for determining if reasonable potential should be evaluated for a non-priority pollutant.

Note: Boeing has completed appropriate statistical calculations but defers the application of best professional judgment and the final determination of reasonable potential to the Regional Board Staff.

FIRST QUARTER 2020
THE BOEING COMPANY
SANTA SUSANA FIELD LABORATORY
NPDES PERMIT CA0001309

January 1 through March 31, 2020

Observation Requirements: Observations are only made during discharge on a monthly basis when 002 (Bell Creek), Outfall 008 (Dayton Creek), and Outfall 009 (Arroyo Simi) are flowing. Outfalls 002 and 009 discharged in January and March during the First Quarter 2020 and Outfall 008 discharged in March during the First Quarter 2020.

Notes:
N/A = not applicable. Since Outfall 009 did not flow during the month of February, no monthly inspection was required at Arroyo Simi for that month.
* = These data were collected to assist in determining compliance with receiving water limitations during the quarter. Upstream data (Figure 2) were compared to the pH and temperature measured at Arroyo Simi sample location RSW-002 (Appendix C) and were within 0.5 unit and 5°F of the upstream field readings; therefore, compliance was demonstrated.

Columns are used to compare laboratory's reporting limits (RLs) and method detection limits (MDLs) to the SWRCB Minimum Levels (MLs) and the permit limits (PLs).
(1) This column indicates the status of analytical capabilities if the ML is less than the laboratory RL and/or MDL. See explanation for "--" below.
The following designations summarize the comparison of RLs, MDLs, MLs, and permit limits:
-- = Laboratory reporting limit meets ML if applicable and permit limit requirements.
--(a) Laboratory reporting limit or method detection limit meets ML and permit limit requirements.
--(b) Laboratory reporting limit or method detection limit meets ML. This analyte has no permit limit requirements.
--(c) Laboratory reporting limit or method detection limit meets permit limit. This analyte has no ML.
--(d) This analyte has no ML or permit limit.
--(e) This analyte is a calculation or chronic toxicity and does not have a reporting limit. This calculation or chronic toxicity has no ML.
--(f) This analyte has no ML. Laboratory reporting limit or method detection limit does not meet permit limit.
--(g) Laboratory reporting limit or method detection limit meets ML, but does not meet permit limit requirements.
In the above context, "meet" means equal to or less than (IE if a Laboratory reporting limit or method detection limit meets a criteria, the laboratory reporting limit is less than or equal to that criteria
The receiving water sediment limits do not have a ML and are included for reference only.

(2) The RL and MDL for asbestos varies based upon the sample.
(3) Total residual chlorine (TRC) and dissolved oxygen (DO) are measured in the field. The RL is the lowest limit of the instrument. The MDL is not relevant for field parameters.
(4) This value is the minimum detectable activity (MDA) which applies only to radiological constituents.

Acronyms:

Quality Assurance Summary (QAS)

Client / Project:	Boeing
QAPP or SOW:	Waste Discharge Requirements for the Boeing Company, Santa Susana Field Laboratory, Order R4-2015-0033, NPDES CA0001309, Los Angeles Regional Water Quality Control Board, April 1, 2015

Project Organization

Project Managers	Urvashi Patel
Special Notification Requirements	Management Changes TestAmerica must notify all parties (Consultant, Mec^{X}) within 30 days of any changes in senior management (Lab Director, QA Manager, Operations Manager, Manager of Project Management) or Project Manager at the laboratory. Certification Changes In addition to providing an annual update on current laboratory methods, certifications, reporting limits and MDLs, any changes in the laboratory's ability to perform requested analyses must be communicated to all parties immediately. Changes will generally be provided no later than October, prior to the start of the rainy season.
Sampling Event Information	The SSFL site is monitored for discharge under NPDES permit CA0001309. This discharge permit encompasses 16 outfalls that are monitored on routine, monthly, quarterly, and annual frequencies as specified in the permit. The outfalls are grouped by their monitoring parameter lists: **Monitoring List*** / **Outfall ID** E-2a: 001, 002, 011, 018 E-2b: 003, 004, 005, 006, 007, 008, 009, 010 E-2c: 019,020 *From Permit table

Sampling Event Information, continued	Monitoring Frequency Tables E-2a, b, and c in the Permit specify the analytical parameters, units, sample type (grab or composite) and sampling frequency. Sampling frequencies may change based on detects, non-detects, and recommendations by the consultants and/or the SSFL expert panel.
Special Bottle Order/Bottle Preps (containers, preservation, etc.)	1) Bottle orders are coordinated between the TestAmerica project manager and the consultant. . The laboratory will be instructed as to what Outfall and events are planned to be sampled so correct bottle sets can be sent. 2) ISRA, BMP and GETs bottle orders are sent in bulk shipments when requested by Consultant 3) Preserved bottles must be individually bagged and an absorbent pad must also be placed each cooler in case of a spill. 4) Laboratory pre-printed labels on NPDES outfall bottle orders when requested by consultant. 5) Laboratory-supplied water for trip blanks must be lot-traceable. 6) When requested by consultant, low level 1631 mercury kits will be utilized for sample collection for method 245.1. Consultant will inform the lab as to whether these unpreserved VOA vials should have nitric acid added to them prior to or after sample collection. **Interim Source Removal Action (ISRA)** Performance Monitoring Samples are collected in accordance with the Los Angeles Regional Water Quality Control Board (LARWQB). Consultant indicates on the COC which samples are to be run through the Dekaport Cone Splitter. These split samples are analyzed by both TestAmerica Irvine and American Scientific Laboratories (ASL).

Sample Pickup	1) All couriers must be on pre-approved courier list to be granted access to SSFL. If an outside courier service is used, the courier must have been audited by TestAmerica. 2) TestAmerica will submit a list of couriers to Consultant with the appropriate documentation so that the courier will be granted access to the site. 3) If a new courier is hired and it is anticipated that he/she will be servicing SSFL, then TestAmerica will pro-actively submit the documentation to Consultant for SSFL approval. 4) At a minimum, appropriate courier documentation consists of the full name of the courier. 5) Custody seals must be placed on the cooler whenever samples are not counted in the field. 6) Check for short-hold analyses on COCs and notify the TestAmerica project manager. a) Bioassay-36 hour holding time may need to be delivered immediately to Aquatic Bioassay Laboratories. b) Hydrazine has a 72 hour holding time so may need to be sent via Fed-ex direct from site to the appropriate subcontract lab: TestAmerica Denver for SSFL NPDES work. c) Notify the TestAmerica project manager of all other analyses with short holding times (48 hours or less) such as Micro, bioassays, Chromium VI, nitrate, pH, and turbidity. d) 525.2 Diazinon and Chloropyrifos has a 24-hour extraction holding time.

Subsampling or Compositing?	Cone Splitting Procedure (see IR-WI-CONE_SPLIT, current revision) 1) The Cone Splitter must be correctly assembled, cleaned, leveled and pre-rinsed prior to use. A Performance Check must be run prior to the first sampling event of the season. 2) There are two levels of cleaning for the cone splitter. Each has a checklist: a) **Level 1** is performed each time before use for samples collected from different sites on the same day. b) **Level 2** cleaning is performed if the splitter has dried before cleaning or was used for splitting sample with known or suspected high level target analytes. 3) Only laboratory staff with documented training on the Cone Splitter Work Instruction (can be involved in the cone splitting procedure. Clarification on Cone Splitter Protocol 1) Performance tests are performed at the request of the Consultant, typically on an annual basis. 2) Sample Volumes: the client submits approximately 4 liters of sample. The final volumes after splitting are approximately 800mL in each 1 Liter container and approximately 400mL in each 500mL container. For dioxin analysis, the dioxin testing laboratory is provided with instructions on the COC to use the contents of both a 1 liter amber and a 500mL amber for testing and to perform a solvent rinse on both containers. For equipment blanks, volume from all 3-500mL ambers are used and solvent rinsed. 3) Holding time: Lab performs cone splitting within 24 hours of receipt. SOP has a recommended holding time of 5 hours if splitting is performed in field or “best professional judgment.” Analyses being performed have holding times of 7 days or greater.

Subcontract Labs	Radiological Sample Preparation 1) Radiological samples subcontracted to an outside laboratory require documentation of sample preparation procedure performed at TestAmerica Irvine. a) Either the Sample Control department manager or the Metals dept manager oversees the processing of these samples. b) Every batch of samples (each 2.5 gallon container) requires a trip blank with the exception of samples for tritium analyses. c) Prepare the trip blank by filling a 2.5 gallon container with Laboratory Reagent-Grade Water (RGW). d) Add 25mL of nitric acid to each sample and trip blank. e) Check pH with pH paper by taking an aliquot of sample using a disposable transfer pipette and squeezing a few drops on the pH strip. (Do not dip pH strip directly into sample container). f) If pH<2, record on log sheet. g) If pH>2, add another 5mL and recheck pH. h) Record sample ID, acid vendor, lot#, date and time on log sheet-see Attachment 2. Note any comments if needed. i) Notify Sample Control that samples have been prepared/are ready to be shipped. j) Sample Control logs in the trip blank (use prep date/time as sample date) on the same work order and logs in the applicable test methods, prints subcontract COC and sends to a pre-approved radiological testing laboratory with original pH adjustment log. Sample Control attaches a copy of pH adjustment log to work order. k) Samples must not be filtered. l) A site specific sample duplicate must be run with each batch of samples. Dioxin Analysis 1) Report in µg/L. 2) Report down to the EDL for non-detects and below the EDL for isomers meeting required signal-to-noise ratios. 3) Narrate any detection below EDL. 4) Confirm all 2,3,7,8-TCDF J-flag hits and report both results. 5) EMPCs are reported as positive results with the appropriate qualifiers. 6) Flag total results as the summation of all flags within the homolog group.

Sample Receiving/Login Instructions

Special forms?	1) Receipt Acknowledgements should be sent within 24 hours of receipt. The format and the delivery instructions are specified in LIMS under the Deliverables section for the project.

Dear Scott Johnson: Certificate No. 1907

Congratulations! This notice advises that the laboratory named above has been accredited as an environmental testing laboratory pursuant to the provisions of the California Health and Safety Code (HSC) Sections 100825-100920. The analyses for which this laboratory is accredited are indicated on the enclosed "Accredited Fields of Testing" List.

The laboratory's accreditation begins on the date printed on the enclosed certificate. For renewed accreditations, this date is determined by compliance with applicable deadlines. Noncompliance with these deadlines may have resulted in lapse of accreditation.

Be advised, the laboratory may have been denied accreditation for one or more analyses for which it applied due to failure to comply with regulatory requirements for application or accreditation. It is the laboratory's responsibility to review the enclosed list and know for which methods the laboratory has been accredited. This accreditation is a final action of the state board, subject to petition under Health and Safety Code Section 116701 within 30 days. However, if you believe that a FOT has been left off of your accreditation in error, you may submit to ELAP within 30 days of this letter, an "Accreditation Inquiry Request Form" located at www.waterboards.ca.gov/elap identifying any mistakes or errors you believe occurred in your accreditation, which will begin the period in which to file a petition. ELAP will then review all timely submitted "Accreditation Inquiry Request Forms" and will make a final determination which could then petitioned to the State Water Resources Control Board. **Failure to submit a petition to the State Water Resources Control Board or an "Accreditation Inquiry Request Form" to ELAP within 30 days of this letter will prohibit you from obtaining any further review of your accreditation.**

HSC Section 100890 lists the civil penalties for environmental laboratories that perform analyses for state regulatory purposes without a valid certificate.

Continued accreditation is contingent upon compliance with HSC Sections 100825-100920 and California Code of Regulations, Title 22, Division 4, Chapter 19, Certification of Environmental Laboratories. ELAP reserves the right to take enforcement action, including issuance of civil penalties, or supension and revocation of the laboratory's ELAP certificate, for failure to comply with all applicable regulations, statutes and orders.

Thank you
